Department of
Mines and Petroleum Resources
ASSESSMENT REPORT
NO. 2164 MAP.....

INTRODUCTION

Location and Access

The Money 1-72 mineral claims are situated at 129°50' West Longitude and 57°40' North Latitude.

The Stewart-Cassiar Highway, which connects up with the Alaska Highway at mile 648, passes within seven miles of the property.

Present access to the property is by helicopter which can be chartered from Dease Lake, British Columbia.

Size of Area

The Money claims cover approximately 2,800 acres with the geochemical survey run over approximately 1,000 acres.

GEOGRAPHY

The claims lie essentially in an alpine plateau with deeply incised valleys cutting the plateau. Elevations range from 4,500 feet in the creek beds to 5,500 feet on the plateau. Drainage is fairly good except for the occasional swampy area on the plateau. The claims are mainly above tree level and vegetation consists only of patches of buck brush. Outcrop is limited to exposures along the creek beds.

GEOCHEMISTRY

Sample Collection and Analysis

Samples were collected every 100 feet along picket lines cut 400 feet apart. A small hole was dug with a shovel at each sample site, and where possible the "B" soil horizon was sampled. After drying, samples 400 feet apart were sent to Chemex Labs Ltd. in North Vancouver for analysis. Analysis for total copper and total molybdenum was by atomic absorption.

Soil Profile

The soils on the Money claims are very favourable for geochemical detection of copper. The diagram on Page 3 shows a typical cross-section of the soil profile, with three distinct and well developed soil layers.

The upper horizon, or "A1" is the area of greatest biological activity and consists of a dark brown soil containing roots and other humus material. The average thickness of the "A1" horizon is six inches.

The "B" horizon, averaging 12 inches thick, is sharply divided from the "A1" horizon and consists of a fine yellowish-brown clay-like soil. This horizon grades gradually into the "C" horizon.

The "C" horizon is made up of numerous rock fragments in a yellowish-brown clay-like soil. The division between the "B" and "C" horizons was arbitrarily set at the upper limit of rock fragments.

SOIL PROFILE

HORIZON

A1

B

C

SAMPLE NO.

P-1

P-2

P-3

SOIL PROFILE RESULTS

<u>Sample Number</u>	<u>P.P.M. Copper</u>	<u>P.P.M. Molybdenum</u>
P-1	233	5
P-2	213	15
P-3	1,300	30

In the low wet areas the soil profile is less favourable. Here the "A" horizon is a highly organic, wet, black soil, which grades into the "C" horizon of mainly rock fragments. In these areas it was impossible to get a good representative soil sample.

INTERPRETATION OF GEOCHEMICAL RESULTS

Copper

Background in the area being approximately 50 ppm copper, only values greater than 100 parts per million were contoured and considered anomalous.

Map 1 - No anomalous values were encountered.

Map 2 - One anomalous sample of 213 ppm copper occurs, however, it is not considered to be related to economic mineralization because of its isolation.

Map 3 - Isolated highs occur but none are considered due to economic mineralization because of their low values and erratic distribution.

Molybdenum

No anomalous values were recorded, thus values were not plotted on maps. (Values in appendix.)

CONCLUSIONS AND RECOMMENDATIONS

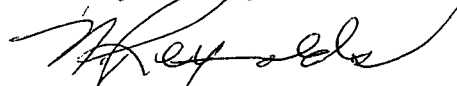

No significant anomalous areas were encountered in the geochemical survey, and no further work is recommended.

QUALIFICATIONS OF NORMAN W. REYNOLDS

I, Norman W. Reynolds, with business and residential addresses in Calgary, Alberta, do certify that:

1. I am a geologist employed with Great Plains Development Company of Canada, Ltd.
2. I am a graduate of the University of Alberta, Edmonton, Alberta. (B.Sc. in Mathematics and Geology).
3. I have been engaged in mineral exploration since 1965, and have worked in Western Canada and Alaska.
4. I personally was on the property and supervised the work on the property.

Respectfully submitted,

N. W. Reynolds, B.Sc.
