#1 LOCATION MAP

INTRODUCTION:

From the 10th of July to the 15th of August, 1970, Associated Geological Services Ltd. carried out Reconnaissance and Detailed Geochemical and Magnetometer surveys on the ZAP #1 and #2 claim groups, in Telkwa Pass, B.C.

These surveys were carried out on the recommendations of W.M. Sharp, P. Eng.

LOCATION AND ACCESS:

Telkwa Pass lies approximately 35 miles east, northeast of Terrace, B.C., at the west end of the Telkwa Range.

Road access is possible, but would be very difficult. Helicopter remains the economical form of transportation into the area.

THE ZAP CLAIM GROUPS:

The ZAP #1 Group, held by location by H.E. Madeisky, consists of ZAP #2, 4, 6, 8, 10 & 12 mineral claims (Record No's. 79490, 92, 94, 96, 98 & 79500), ZAP #14-18 mineral claims (Record No's. 79502-06), ZAP #33-40 mineral claims (Record No's. 79521-28), ZAP #43 FR. fractional claim (Tag. No. 124544M), ZAP #48 FR. fractional claim (Tag No. 118526M), ZAP #44 mineral claim (Tag No. 118522M) and ZAP #46 mineral claim (Tag No. 118524M).

The ZAP #2 Group, held by location by H.E. Madeisky, consists of ZAP #1, 3, 5, 7, 9, 11 & 13 mineral claims (Record No's. 79489, 91, 93, 95, 97, 99, 79501), ZAP No's. 19-32 mineral claims (Record No's. 79507-20), ZAP #41 FR. and 42 FR. fractional claims (Tag No's. 124542M & 124543M) and ZAP #45 & # 47 mineral claims (Tag No's. 118523M & 118525M).

GEOGRAPHY:

Altitude : Telkwa Pass, 2500 ft.  
Relief : 5000 Ft.  
Slopes : avge. 30-35°.  
Precipitation : in excess of 200" per year.  
Vegetation : Spruce, Fir, Balsam and Devils Club in the vicinity  
of water courses.

FIELD METHODS:

## (a) Geochemistry (See Fig. 2).

A total of 276 soil samples were taken at 100 ft. intervals along lines spaced 200 ft. apart from the B or C horizon wherever possible. Samples were obtained by digging a hole with a shovel at each station and collecting approx. 3/4 cupful of soil in a standard high wet-strength kraftpaper sampling bag. The samples were examined in the field for soil-type and approx. organic content. Samples were shipped to Bondar, Clegg & Co. in North Vancouver, B.C., where they were dried in proper drying ovens. A portion of the -80 mesh fraction of each samples was assayed by the hot Aqua Regia/Atomic Absorbtion method for parts per million copper. Samples from the line R1-40W-50W were also assayed for ppm gold, silver, lead and arsenic and samples from line R1-0W-40W were assayed for lead as well, by the above method.

MAGNETOMETER SURVEY: (See Fig. 2).

Magnetometer readings were taken at all stations of the geochemical grid, using a SHARPE MF-1 Flugate Magnetometer. This instrument measures the intensity of the vertical component of the magnetic field with an accuracy

of  $\pm$  5 gammas. Corrections for the diurnal variations in the magnetic field were made in the field and correlated with magnetograms from the Dominion Astrophysical Observatory in Victoria, B.C.

#### DISCUSSION OF RESULTS:

##### (a) Geochemical (Fig. 3).

Lead, gold, silver, zinc and arsenic values are of insufficient quantity for statistical treatment and have been omitted from the report. A histogram plot of the ppm copper values indicates a background of 35 ppm and a threshold of 100 ppm. In all cases the Cu. highs are directly related to mineralized shear and/or fracture zones. On the W-half of the property (Reconnaissance Grid) these shear zones trend N.E. and on the E-half of the property the shear zones trend E-W.

##### (b) Magnetometer Survey

Examination of magnetometer results show two significant anomalies. The higher anomaly is at R3 - 50W and is approx. 2000 gammas above background. This anomaly lies in a N.E. trending fault zone and is possibly the result of a concentration of magnetite and ilmenite. Although there is no copper mineralization directly associated with the anomaly, it outlines an area of moderate to intense (heat?) alteration. The other anomaly lies between 25-10W and 4N-12W. This anomaly, approx. 1500 gammas above background, reflects a concentration of magnetite in a series of E-W shear and fracture panels. In this instance the magnetite is associated with chalcopyrite, cubanite and some chalcocite. The remaining magnetometer highs coincide with faults or shear zones, and are the result of a concentration of the magnetic variety of specular hematite, commonly found in these zones.

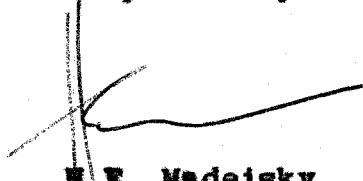

SUMMARY AND CONCLUSION:

The results of the soil sampling outline found areas, which are associated with mineralized shear and fracture panels (i.e. O-N/S-11E). Although none of these zones are singularly of any great significance, grouped together they outline an E-W trending system of shear and fracture panels, which may prove to be an attractive exploration target.

The results of the magnetometer work coincide, in most instances, with the Geochemical results, and indicate that there is a certain degree of alteration associated with the above mentioned shearing and fracturing; particularly on the W. end of the property.

Both Geochemical Methods and the Magnetometer have proven to be reliable and useful tools in the exploration of this property.

Respectfully submitted,

H.E. Madeisky

W.M. Sharp.

Vancouver, British Columbia

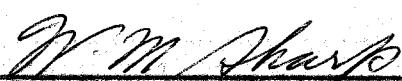

October 26, 1970.

CERTIFICATE

I, William M. Sharp, with business and residential addresses in North Vancouver, British Columbia, DO HEREBY CERTIFY THAT:

1. I am a graduate of the University of British Columbia with an M.A.Sc. (1950) degree in Geological Engineering.
2. I am a registered Professional Engineer in the Province of British Columbia.
3. I have practiced my profession for 20 years, and as a consultant since 1964.
4. I have personally visited the Zap #1 and #2 Claim Groups during the period of the survey herein reported, and am satisfied that appropriate geochemical and geophysical survey procedures have been correctly employed.
5. To the best of my knowledge the interpretation of the data and expenditures claimed for this survey are relevant and correct.

Respectfully submitted,

  
W.M. Sharp, P.Eng.

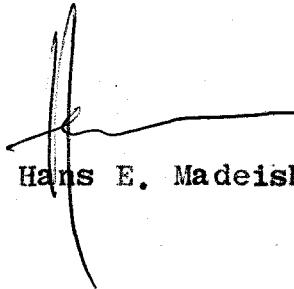

North Vancouver, British Columbia  
October 14, 1970.

## STATEMENT OF QUALIFICATIONS

I, Hans E. Madeisky, with business address in Vancouver, British Columbia, do hereby certify that:

1. I am a Geologist, having completed three years towards a B.Sc. in Geology at El Camino College and the University of Southern California.
2. I have three years experience in Geological Exploration, one of which is concentrated on Geochemical Exploration.
3. I personally supervised the Geochemical and Magnetometer Surveys of the ZAP Claim Group, described herein.

Respectfully submitted,

Hans E. Madeisky

PHONE 988-5315**GEOCHEMICAL LAB REPORT**

No. 20 - 250

Extraction Hot aqua regia, fire assay,  $\text{HClO}_4\text{-HNO}_3$  From Associated Geological Services

Method Atomic absorption, colorimetric

Date July 4, 1970 19

Fraction Used -80 mesh

Analyst K.B.
