INTRODUCTION

Between October 15th and 19th, 1971, Peter E. Walcott & Associates Ltd. carried out limited ground magnetic and electromagnetic surveys over part of a property, located in the Port Hardy Area of Vancouver Island, British Columbia, held by Gordon Milbourne.

The surveys were carried out over two grids, the lines of which were turned off at right angles from east-west baselines and chained and picketed at 100 foot intervals, as well as along access logging roads.

The results are shown on plan maps of the line grids, Maps W-145-1 to -3 that accompany this report, with the data being presented in contoured form in the case of the magnetic survey except on the road survey, and in profile form in the case of the E.M. work.

PROPERTY, LOCATION AND ACCESS

The property is located in the Nanaimo Mining District of British Columbia, and consists of the following claims:

<u>Claim Name</u>	<u>Record Number</u>
RIB 1 - 2	24256 - 57
RIB 3 - 14	24310 - 321
RIB Fr's 1 - 2	24258 - 59
RIB Fr's 3 - 8	24322 - 327
REEF 35 - 36	37781 - 82

The claims are situated about $1\frac{1}{2}$ miles north north-west of the Island Copper deposit and some 5 miles south of the town of Port Hardy, British Columbia.

Access can be obtained from Port Hardy by means of the logging roads that cross the property.

PURPOSE

The purpose of the survey was to investigate the possible occurrence of economic sulphide deposit (s) that could conceivably occur on the property as a result of the favourable geology.

GEOLOGY

The reader is referred to the 1968 report by K. Northcote of the B.C. Ministry of Mines and to unpublished reports held by G. Milbourne.

Briefly the property is underlain by Triassic Karmutsen basic volcanics, Lower Jurassic Bonanza intermediate volcanics and Upper Triassic and Lower Jurassic sedimentary rocks which have been intruded by Late Jurassic to Tertiary intrusions as shown on the geology map (Map W-145-1).

SURVEY SPECIFICATIONS

The basic principle of any electromagnetic survey is that when conductors are subjected to primary alternating fields secondary magnetic fields are induced in them. Measurements of these secondary fields give indications as to the size, shape and conductivity of conductors. In the absence of conductors no secondary fields are obtained.

The electromagnetic survey was carried out using a Crone J.E.M. unit. This system utilizes the "shoot back" technique, which requires a receiver and transmitter in each unit. Each unit measures the direction of the total magnetic field (in degrees from the horizontal) in turn while the other unit acts as the transmitter. On addition of the two measured angles the resultant reading obtained is independent of substantial differences in elevation, and is plotted midway between the two coils.

Readings with this instrument were taken every 100 feet along the lines using 200 and 300 feet coil separations and frequencies of 480 and 1800 c.p.s. respectively.

The magnetometer survey was carried out using a McPhar M-700 fluxgate magnetometer. This instrument makes measurements of the vertical component of the earth's magnetic field to an accuracy of + 10 gammas. Corrections for diurnal variations were made by tying-in to previously established base stations at intervals not exceeding two hours.

Readings with this instrument were taken every 100 feet along the lines with additional closer spaced readings in areas of steep magnetic gradients.

DISCUSSION OF RESULTS

The magnetometer survey (map W-145-2), as carried out in the vicinity of the intrusive-limestone-volcanic contact, was in general insufficient in coverage, particularly on Grid 1 and on the road traverses, to properly obtain correlation with the known geology (Map W-145-1).

It did however show Grid 2 to be underlain by at least two magnetically different rock units, units M₁ and M₂, above which two magnetic highs were clearly discernible.

These highs, the larger and more intense of which is undefined, are located near the mapped intrusive-limestone-volcanic contact, are most probably caused by magnetite mineralization, and could be indicative of a pyrometasomatic deposit.

Another magnetic high was obtained on Line E, a road traverse. This high lies some 1600 feet east of the stronger magnetic high on Grid 2 and could conceivably be part of the latter.

The E.M. survey, as performed with a 200 foot coil separation except over Lines 13 E, 14 E and 15 E respectively where a 300 foot coil separation was used over the magnetic high, gave good signal strength and sharp clear nulls throughout, indicating little or no overburden and no out of phase component, and failed to locate the presence of any anomalies.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Between October 15th and 19th, 1971, Peter E. Walcott & Associates Ltd. carried out limited ground magnetic and electromagnetic surveys over part of a property held by Gordon Milbourne.

The property, the Rib and Reef claims, lies about $1\frac{1}{2}$ miles north of the Island Copper Mine on Vancouver Island.

The magnetic survey cover was insufficient to obtain proper correlation with the known geology, but did indicate the presence of three magnetic anomalies which lie near the intrusive-limestone-volcanic contact.

The E.M. survey failed to locate the presence of any anomalies.

As a result of the above surveys the writer concludes:

- (1) No significant massive sulphide mineralization exists within 100 feet of surface over the area surveyed, and within 150 feet of surface over the main magnetic anomaly.
- (2) The magnetic anomalies are most probably caused by magnetite and could be indicative of a pyrometasomatic deposit.

He therefore recommends that further work be done on the property to explore this possibility.

This work should consist of:

- (1) Magnetic surveying to properly define and qualitatively and quantitatively investigate the main magnetic anomaly.
- (2) Soil sampling over and around the magnetic anomaly.
- (3) Turam, i.e. deep penetration E.M., and limited I.P. surveys over the area of interest. It should be borne in mind here that a high I.P. background response would be expected due to the pyrite content of the volcanics.

Should this work prove encouraging it should be followed by further investigation using borehole techniques.

Respectfully submitted,

PETER E. WALCOTT & ASSOCIATES LIMITED

COST OF SURVEY

Peter E. Walcott & Associates Limited undertook the E.M. and magnetic surveys on a line mile basis. Draughting and mobilization costs were extra so that the total cost of services provided by Peter E. Walcott & Associates Limited was \$1,304.60.

Gordon Milbourne carried out the linecutting, acted as helper on the E.M. and magnetic surveys, and provided local transportation and room and board for the crew. A breakdown of the costs are as follows:

Linecutting -		
12 days at \$30.00 per day		\$360.00
Geophysical survey -		
5 days at \$30.00 per day		\$150.00
Vehicle cost -		
17 days at \$15.00 per day		\$225.00
Room and board -		
22 man days at \$12.50 per day		\$275.00
		<hr/>
		\$1,010.00
		<hr/>

Therefore the total cost of the survey was \$2,314.60.

CERTIFICATION

I, Peter E. Walcott, of the Municipality of Coquitlam, British Columbia, hereby certify that:

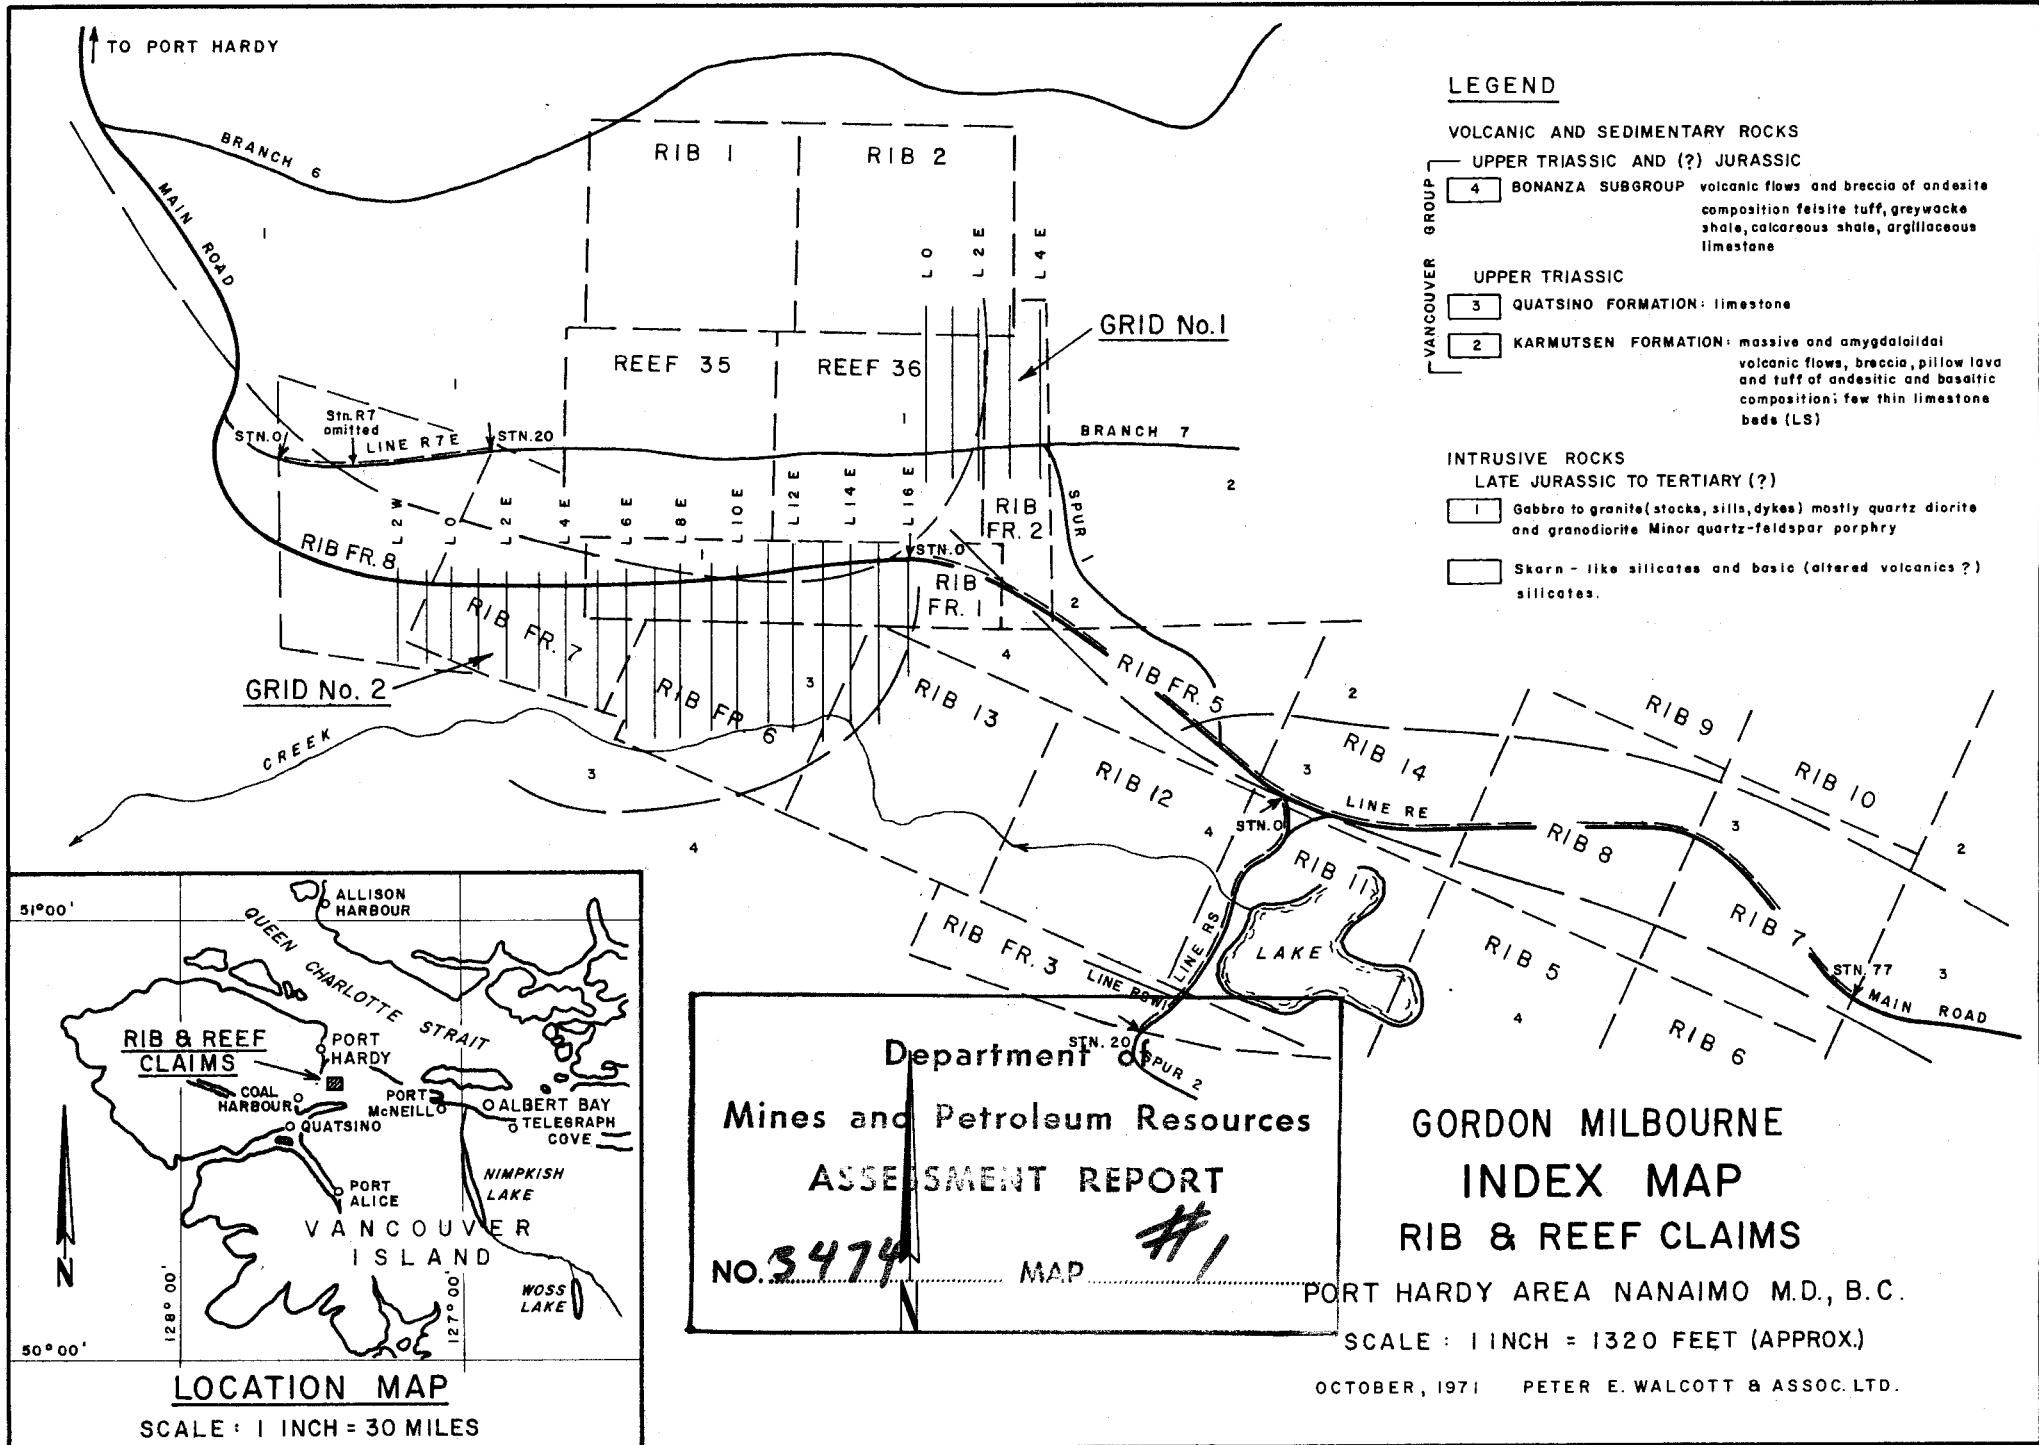

1. I am a Graduate of the University of Toronto in 1962 with a B.A.Sc. in Engineering Physics, Geophysics Option.
2. I have been practising my profession for the last nine years.
3. I am a member of the Association of Professional Engineers of British Columbia, Ontario and the Yukon Territory.
4. I hold no interest, direct or indirect, in the Rib or Reef claims.

Peter E. Walcott, P.Eng.

CERTIFICATE OF ASSAY

TO Spartan Explorations Ltd.
 303 - 1035 W. Pender St.
 Vancouver 1, B.C.

Report No: A21-772
 Samples Rec'd: Oct. 14, 1971
 Results Completed: Oct. 25, 1971

c.c. J.S. Vincent Ltd. Project: Eagle Claims

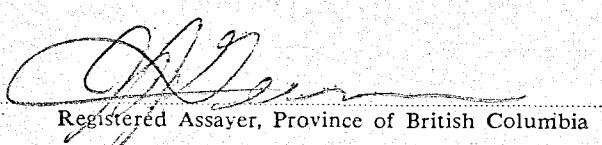

I hereby certify that the following are the results of assays made by us upon the herein described Ore samples.

MARKED Ore	GOLD		SILVER	Cu	MoS ₂	Percent	Percent	Percent	Percent	Percent	Percent	TOTAL VALUE PER TON (2000 LBS.)
	Ounces per Ton	Value per Ton	Ounces per Ton	Percent	Percent							
1606			0.04	0.04	0.005							
1607			0.12	0.92	0.003							
1608			1.2	3.65	0.003							
1609			Trace	0.76	0.002							
1610			1.6	6.90	0.002							
1611			0.63	2.30	0.001							
1612			0.50	3.35	0.002							
1613			Trace	2.25	Trace							
1614			0.58	3.50	0.002							
1615			0.04	0.04	0.002							
1616			0.04	0.22	Trace							
1617			0.04	0.20	Trace							
1618			0.02	0.01	0.001							
1619			0.02	3.02	0.005							
1620			0.04	0.04	0.004							
1621			0.02	0.08	0.003							
1622			0.02	0.66	Trace							
1623			0.23	1.95	0.022							
1624			Trace	1.40	0.024							
1625			0.02	0.22	0.004							
433			1.5	4.60	0.001							
4336			Trace	0.60	Trace							

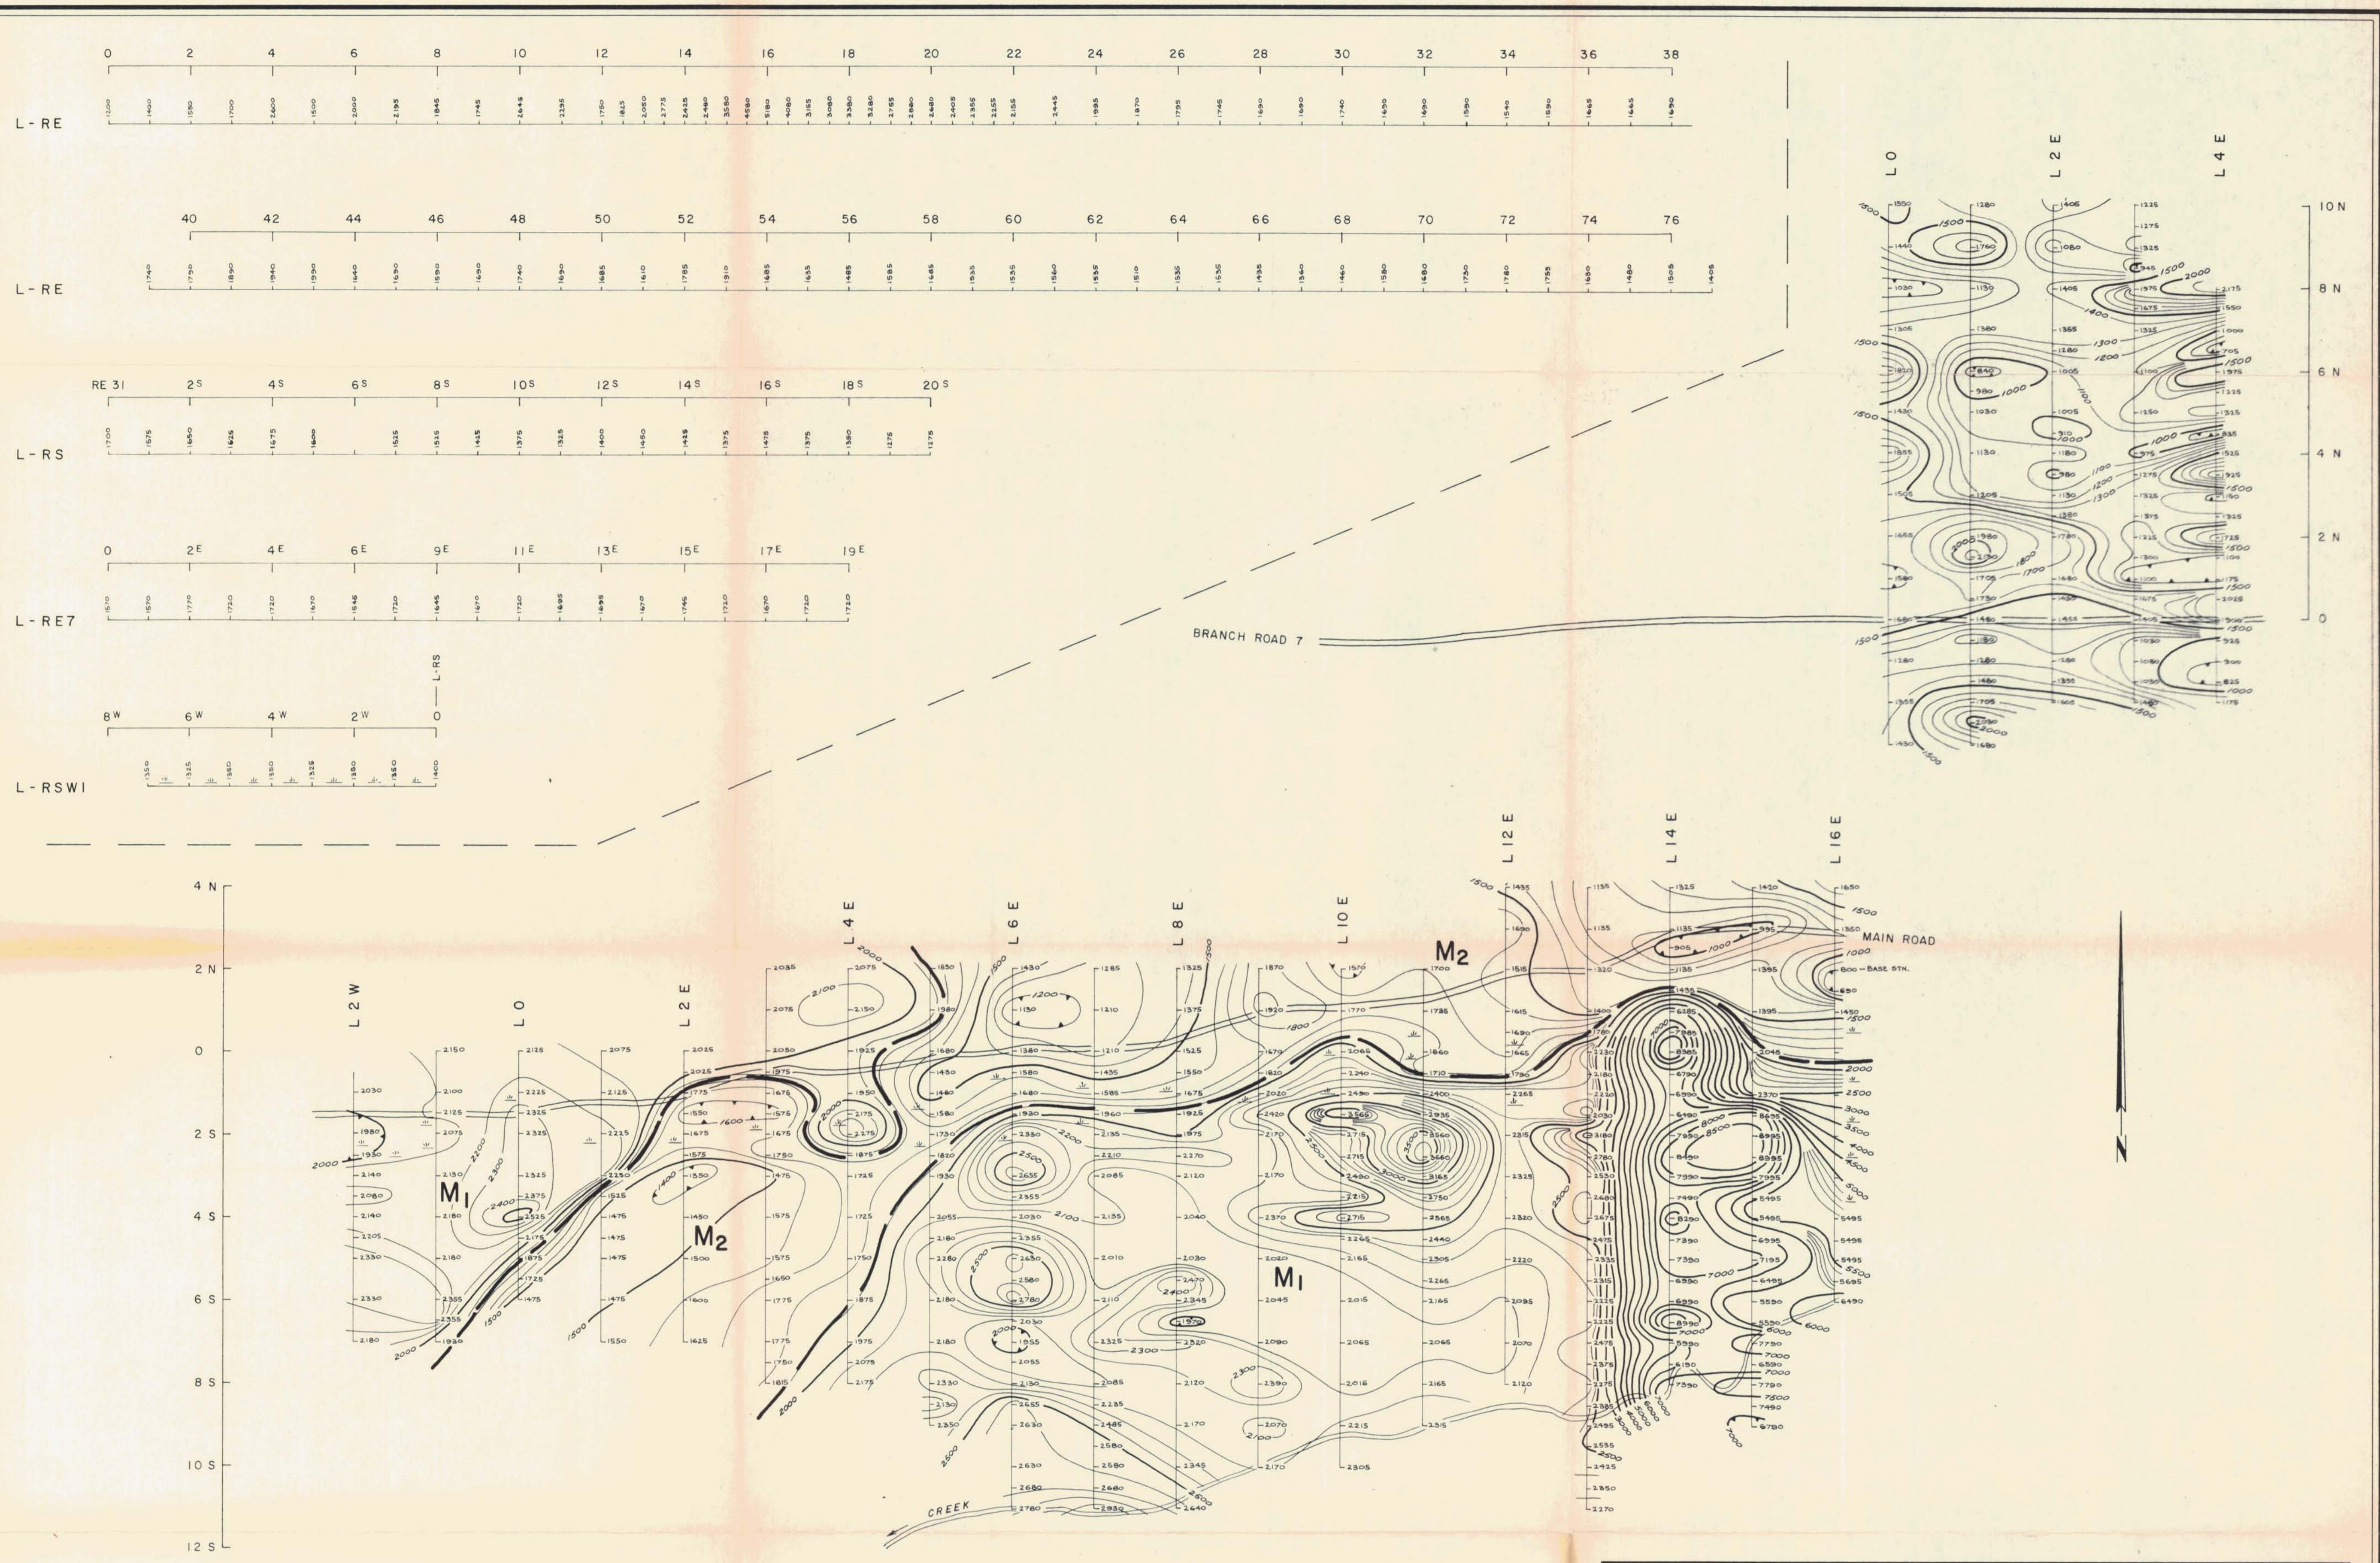

NOTE:
 Rejects retained two weeks
 Pulps retained three months
 unless otherwise arranged.

Gold & Silver values reported on these sheets
 have not been adjusted to compensate losses and
 gains inherent in fire assay methods.

Gold calculated at \$ per ounce

Registered Assayer, Province of British Columbia
