

PROSPECTING REPORT

MINERAL CLAIM

1974 ---- 1975

The 133¹/₂ Mineral Claim is recorded on Mineral Claim Map 82 4/8 1.(A) and is covered by airphoto I.S. 4264 - 221. The initial post is at approx. 113° 23' Long. 49° 29' Lat. And is approx 1200' E. of Surrell Cr., and 3500' N. of St. Annes Cr. The claim is about 30¹/₂ miles due N. of Grand Forks, by way of the N. Fork road, and the new and rebuilding of old logging roads by Pope & Falbot in conjunction with the Forestry Dept. The claim lies between 2450' to 2550' elevation.

There is no indication that this ground has been previously staked or recorded. And no old or recent signs of prospecting was found, although an old forest fire and a recent one in 1973, which covers 90% of the claim, may have destroyed any such signs.

The vegetation now is mostly burnt Jackpine, most of which is still standing, and grass. Rock outcrops are confined to the N.W. portion of the claim, where they have been exposed by the most recent forest fire.

This area is covered by G.S. Map 6 1957, Kettle River, S.D. Sheet 82 2 (East Half) One inch to Four Miles.

This Map shows the rock formation to be of the Anarchist Group of Paleozoic age, contacted by Nelson Intrusives of Mesozoic age on the E. In the 133¹/₂ claim this contact runs diagonally in a N.W.-S.E. direction in the N.W. part of the claim.

The Anarchist rocks are mainly greenstone locally chloritic, impure limestone, greywacke and argillite. The Nelson Intrusives are diorite and granodiorite, with a few small apalite dykes. Both the Anarchist and Nelson formations have been intruded by pulaskite dykes, these are slightly radioactive,

to 3 times background, which is likely due to potassium & H₂O.

Gold was first found on June 10/74 in the dirt, and from crushed rock samples of a small quartz-calcite vein, that had been exposed on the new right of way being bulldozed by the road construction crew. It was lost for the time being and subsequently staked on July 15/74, and recorded in Grand Forks Aug. 2/74.

Description of Mineralized Showings

Showing #1-- A few quartz stringers 1' to 1' wide, in a greenstone pinch out to the N.W., to the S.W. they converge to form 2 parallel quartz-calcite veinlets 2" wide each, 4" apart which in turn become one vein 6" wide, with calcite making up 90% of the vein, this zone is exposed for 15'. Mineralization in the vein consists of chalcopyrite, bornite, stibnite, and pyrite. Smeears of native copper are along joint and shear planes of the zone on the foot wall, dirt taken from this showing runs gold, as does the crushed and burnt vein material. No gold was found in crushed mineralized wall rock samples. The showing strikes approx. N 20° E and dips 35° S.W., it is terminated to the S.W. by a small fault, direction of movement unknown, this fault strikes 47° E and dips 70° S.W., no samples have been assayed, but values would appear to be erratic.

Showing #2-- Is 45' S.W. of #1 and was found by panning overburden looking for the faulted extension of #1 showing, the dirt pannings gave only minor amounts of gold, but tails up to 3" long of native silver were found, subsequent trenching uncovered a zone containing stringers of quartz, calcite, galena, sphalerite, pyrite and chalcopyrite, in calcareous limestone-greywacke formation. The strike and dips of these stringers are erratic, striking in a general N.-S. direction as does the zone, dips of the stringers are from 10° to 70° S.W., the zone appears to average a 20° dip to the S. These stringers are

from 1" to 3" wide, one sample assayed for Au. & Ag. only, ran .052 Au. 3.42 Ag.

Showing #3--- This is a small area, 35' S.W. of #1, of frost heaved rock from in place or angular boulders moved from their place of origin, trenching failed to prove them in place. The rock type is the same as #2 showing, but only pyrite was found, gold was recovered in a few dirt pannings, but none from rock samples crushed.

There are a few minor cop. occurrences to the W. of the showings, as specks and a small shear in the greenstones, but no gold in any of the pannings.

There is scattered pyrite and pyrrhotite in the diorite close to the E. boundary of the claim beside the road, also in the greenstones 500' W. of the showings close to the argillites, but outside of the showings themselves nothing of value has up to date been found.

The Geochem sheet is for reference only, and not applied for as assessment work. There 8 soil sample was taken, it is boulder covered, one which is very similar to the porphyritic granite on the Burr claims to the E., although no zinc was found in this boulder, there may be some buried which may account for the high zinc result.

Date of this report, July, 8, 1975.

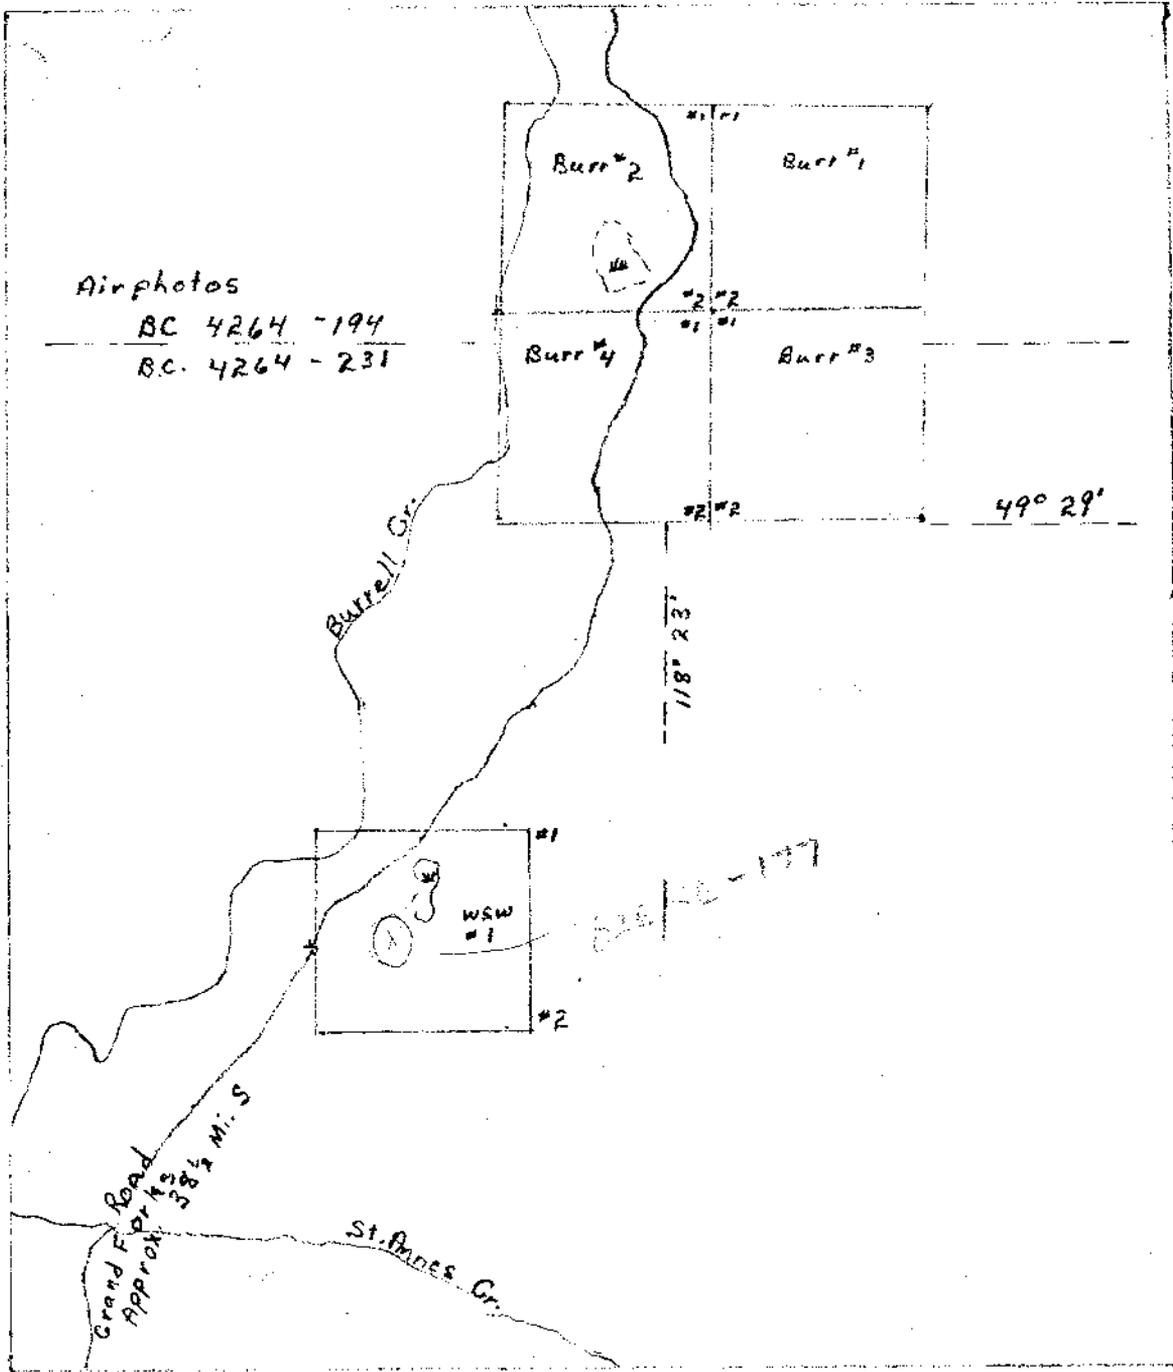

I have taken the U.S. Dept. of Mines and Petroleum Res. test at Grand Forks, N.D. on May, 13, 1975.
