INTRODUCTION

The R.R.S.P. #3 claim was located in the staking rush that followed the announcement by Noranda of a significant copper-zinc discovery in the Goldstream River area north of Revelstoke.

The following report covers the work carried out as recommended in a preliminary report by Dr. R.H. Seraphin, and has been prepared to fulfill the requirements of the Mineral Act governing the filing of geochemical work for assessment credit.

SUMMARY & CONCLUSIONS

Between July 27 and August 5, R. Peel and R. Menzies, collected 146 silt and soil samples in a preliminary exploration test of claim R.R.S.P. #3.

All creeks draining the property were traversed and where possible silt and soil samples were taken. Except for one sample location, H2, where a trace of chalco was noted in the gneissic granite and this mineralization is confirmed by a copper high of 130 p.p.m., the samples returned low order values for copper, lead and zinc.

On the basis of the program only further prospecting in the vicinity of the limestone float can be recommended.

PROPERTY

Mineral claim R.R.S.P. #3 was recorded on March 4, 1976 by Larry Sostad. The claim consists of 20 units and is located about one unit west of the location shown on the claim map.

LOCATION & ACCESS

The claim is located 2 kilometers south east of Goldstream occurrences. This area is accessible from Revelstoke 70 kilometers on highway 23 then 14 kilometers east on good gravel road.

Although only 2 kilometers from the gravel roads, helicopter is necessary to work claim R.R.S.P. #3 because of the rugged nature of the terrain.

GENERAL

The claim is located on the steep northerly sloping side of the Goldstream River valley between elevation 1200 and 1800 meters.

Normal weather in this area is overcast with rain in summer and heavy snow in winter making a very short field season. Snow was still on the ground at the higher elevations when the program was started on July 27.

Overburden is general, with much large talus, which prevents the recovery of silt samples from portions of the streams.

GEOLOGY

The general geology of this area is available in G.S.C. Summary Report for 1928 and G.S.C. Paper 64-32.

The geology and mineral occurrence in the Goldstream area are thoroughly covered by the B.C. Minister of Mines Geological Field work report for 1976, p. 17 to 29 inclusive.

Claim R.R.S.P. #3 appears to be largely underlain by granite but the considerable granite talus from the numerous cliffs could cover other map units. This appears to be the case close to the north boundary where limestone float was noted.

Much of the granite is foliated and resembles a gneiss.

GEOCHEMICAL SURVEY

Between July 27 and August 5 R. Peel and R. Menzies, both experienced graduate geologists, carried out the preliminary geochemical test of the claim.

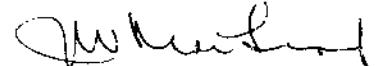

While prospecting the creeks which cross the property, silt samples were taken at regular intervals. Bank samples were also taken. A total of 146 samples were collected and analysed for copper, lead and zinc.

Only one sample site gave anomalous values, 130 p.p.m. copper and 235 p.p.m. zinc. These values are explained by the presence of minor chalco pyrite in the gneissic granite outcrop at this location.

RECOMMENDATIONS

On the basis of the results of the preliminary investigation only limited prospecting of this claim, in the vicinity of the limestone float, can be recommended.

Respectfully submitted,

J.W. MacLeod, P. Eng.

Vancouver, B.C.

North Vancouver, B. C. V7P 2S3

SUBJECT: Analytical procedure used to determine hot acid soluble Cu,
Pb and Zn in geochemical silt and soil samples.

Re: Geochemical Analytical Report # 76-42-001, August 10, 1976

1. Sample Preparation

- (a) Geochemical soil or silt samples were received in the laboratory in wet-strength $3\frac{1}{2}$ x $6\frac{1}{2}$ Kraft paper bags.
- (b) The wet samples were dried in a ventilated oven.
- (c) The dried soil and silt samples were sifted by using a shaking machine with 80-mesh stainless steel sieves. The plus 80-mesh fraction was rejected and the minus 80-mesh fraction was transferred into a new bag for analysis later.

2. Methods of Digestion

- (a) 0.50 gram of the minus 80-mesh samples was used. Samples were weighed out by using a top-loading balance.
- (b) Samples were heated in a sand bath with nitric and perchloric acids (15% to 85% by volume of the concentrated acids respectively).

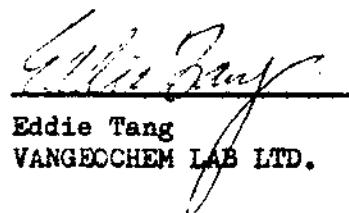

.....2

- (c) The digested samples were diluted with demineralized water to a fixed volume and shaken.

3. Method of Analysis

Cu, Pb and Zn analyses were determined by using a Techtron Atomic Absorption Spectrophotometer Model AA4 or Model AA5 with their respective hollow cathode lamps. The digested samples were aspirated directly into an air and acetylene flame. The results, in parts per million, were calculated by comparing a set of standards to calibrate the atomic absorption unit.

4. The analyses were supervised or determined by Mr. Conway Chun and the laboratory staff.

ENGINEERS CERTIFICATE

I, James W. MacLeod, of 1220 Arbutus Street, in the city of Vancouver, in the Province of British Columbia,
DO HEREBY CERTIFY:

1. That I am a Consulting Engineer, with a business address at #333-885 Dunsmuir Street, in the City of Vancouver, in the Province of British Columbia.
2. That I am a graduate of the University of Alberta with the degree of B.Sc. in Mining Engineering.
3. That I have actively practiced my profession in Mineral exploration since graduation in 1946.
4. That I am a registered Professional Engineer in the Province of British Columbia.
5. That this report on claim R.R.S.P. #3 is based on the results of field work carried out by R. Peel and R. Menzies between July 27 and August 5, 1976 under the direction of the writer.
