PERCUSSION DRILLING
ULLA GROUP I.P. & COPPER ANOMALIES

INTRODUCTION

Previous surveys on this property outlined a partially co-incident Induced Polarization and copper in soil anomalies.

Three holes were located to test these anomalies.

DRILL RESULTS

Hole #1 - drilled Oct. 13, 1978

- 0-35 - Overburden
- 35-330 - Dark fragments probably sediments to 80
 - then mainly light colored probably granite to 330
 - disseminated pyrite throughout, heavy from 200 to 210
 - no copper or moly identified.

Hole #2 - drilled Oct. 14 and 15, 1978

- 0-90 - Overburden
- 90-330 - Mainly hornfelsic sediments, 220 to 260 quartzitic or granite.
 - minor pyrite

Hole #3 - drilled Oct. 15-16, 1978

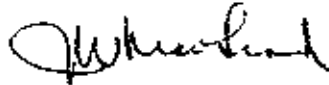

- 0-50 - Overburden
- 50-340 - Hornfelsic sediments probably some green stone bands.
 - pyrite throughout but heavy from 200 - 220.
 - no copper or moly identified.

CONCLUSIONS

The pyrite mineralization is sufficient to explain the induced polarization anomaly but no copper was found in the cuttings.

In view of the unexpected depths of overburden and the water courses noted the copper anomaly may be due to mineralization located to the north of the area drilled.

Respectfully submitted,

J.W. MacLeod, P. Eng.
