GEOCHEMICAL SURVEY

TOPOGRAPHIC SURVEY

ADRIANA CLAIM #346

25-5-78 : 25-7-78

INTRODUCTION

The Adriana property is 33 kilometers north of Princeton and 64 kilometers south of Merritt, via Highway #5. It is 600 meters east of Highway #5 and 1,500 meters north of Allison Lake.

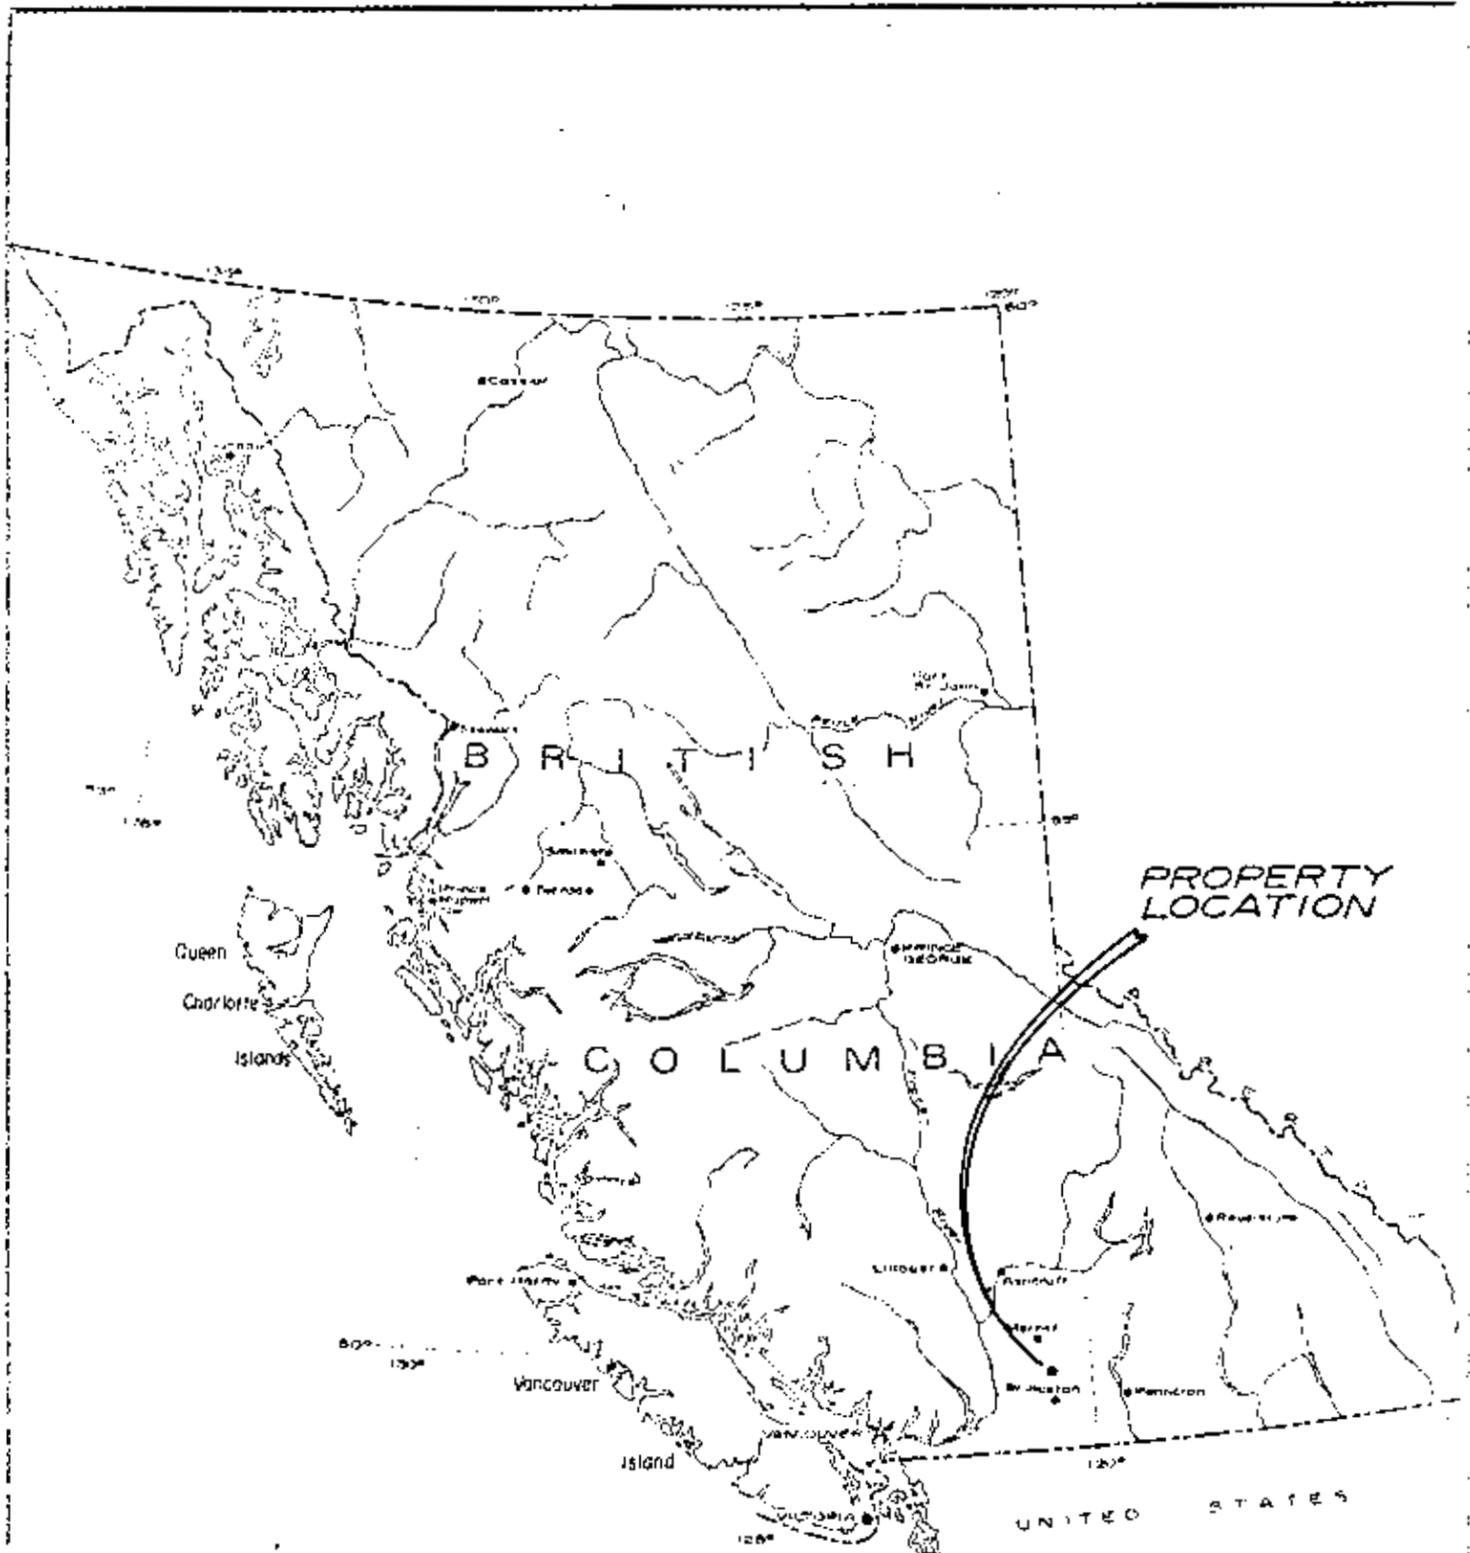

Access over the claim is provided by logging roads.

The legal corner post is located on the south side of the hydro line road, on the north side of the sharp bend in Allison creek. This is approximately 2000 meters northeasterly from the bridge over Allison creek on Highway #5.

The original claim was abandoned and relocated on behalf of Bute Resources Inc., May 23, 1978.

Prior to the survey no significant copper mineralization had been exposed on the Adriana claim, but two kms. to the south geological and geophysical investigations had outlined sufficient copper mineralization to warrant trenching and diamond drilling.

A surveyed grid was established over the 10 unit Adriana claim. A base line was surveyed by chain and Brunton compass along the west boundary. At 100 meter intervals cross lines were surveyed 1,000 meters to the east boundary. Stations were established along the lines at 50 meters intervals.

BUTE RESOURCES INC.	
LOCATION MAP	
SCALE: 1" = 135 Miles	
Drawn by	Date 27/7/78
Checked by	Drp no. 1
ALLEN GEOLOGICAL ENGINEERING LTD	

Prior to May 23, the south seven lines of the claim had been soil sampled. From June 5 to 16, the lines 3,4,5 and 6 were sampled at intermediate stations, and lines 8 to 25 were sampled at all stations. Three hundred and ninety-three soil samples were acquired and assayed for copper.

At all stations aneroid observations were recorded and elevations mapped after corrections for atmospheric variations. Roads, creeks and swampy areas were mapped.

PROPERTY

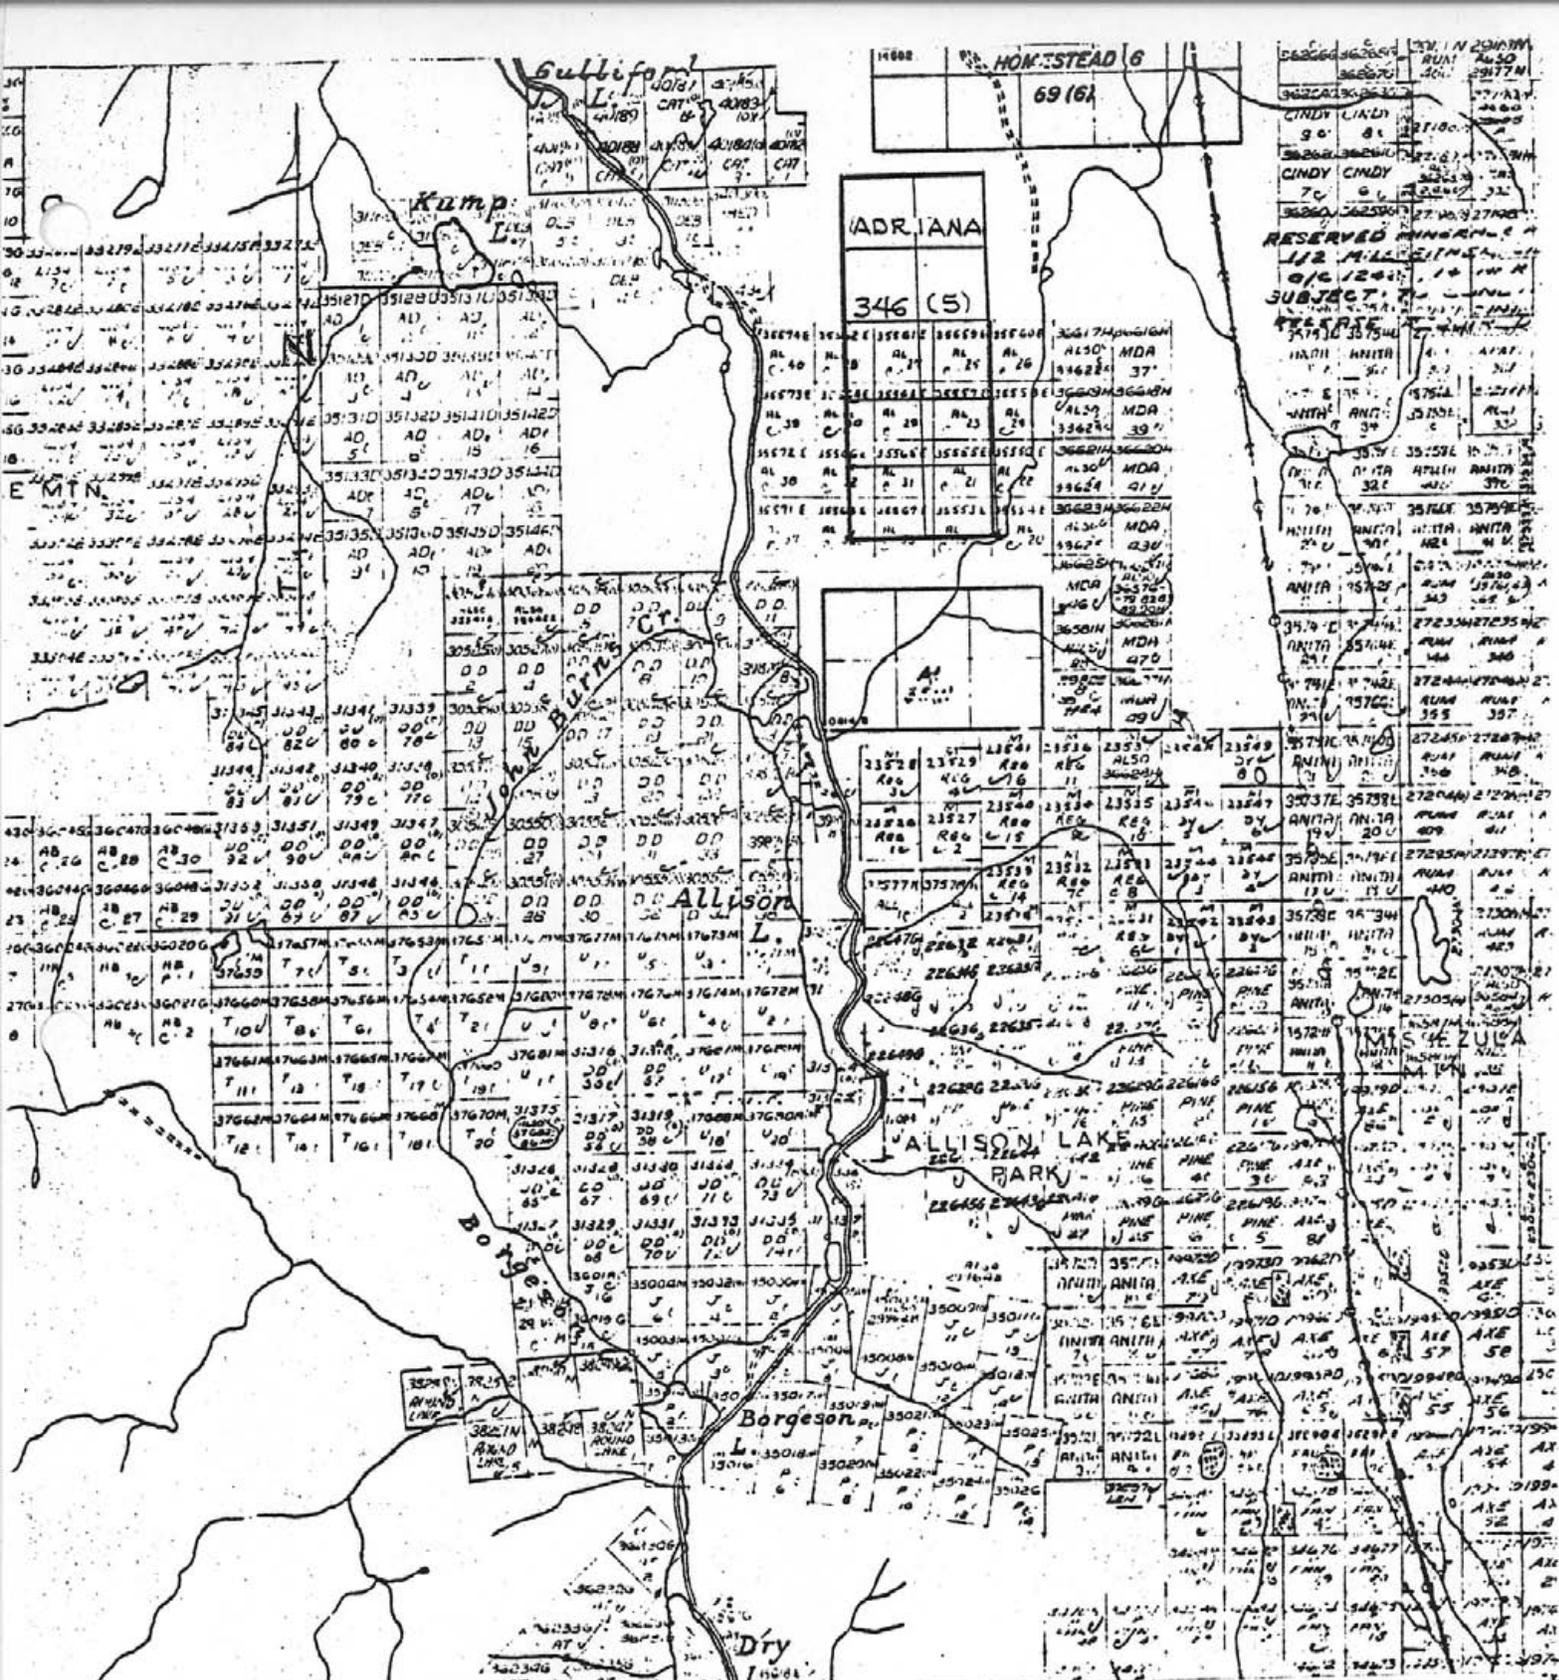

The Adriana claim extends from the legal corner post west 2 units and north 5 units. Metal tag #36870 is attached to the post on the south side of the hydro line and north bank of Allison creek at the sharp bend. This is approximately 2000 meters northeasterly from the Allison Creek bridge on Highway #5.

The claim was staked May 20 and 21 by T. Thomas and recorded as agent for Bute Resources Inc. on May 23, 1978. The record number is 346.

TOPOGRAPHY

The property lies on a broad rolling ridge between elevations of 1,230 and 1,340 meters above sea level on the northwesterly slopes of Missezula Mountain. Allison creek flows across the southeast corner of the claim.

A topographic survey was made of the claim area.

BUTE RESOURCES INC.

INDEX MAP

ADRIANA 1-10 346 (5)

No. 2

31/7/78

Allen Geological Engineering Ltd.

Per Alfred Allen P.Eng.

B.C. Dept. Mines 92 H 105

A 5-inch Terra Surveying altimeter was used to determine elevations at all grid stations and some intermediate points. The direct-reading dial is calibrated to 5 feet. Each day elevations were noted in Princeton and the necessary correction noted. At the Allison creek bridge similar notations were recorded and at designated stations over the surveyed grid, elevations were checked several times per day and appropriate corrections made. Twice each day final elevations were calculated and recorded in a notebook and on a field map.

Roads, streams, and swamp areas were noted on the grid and field map. The hydro line and gas pipeline were located and mapped.

Maps #3 and #4 in the pocket of this report shows the topography of the Adriana claim.

GRID CONTROL

A chain and Brunton compass survey was made over the Adriana claim and a grid tied to a baseline along the west boundary established. Stations were staked every 100 meters along the base line, from which cross lines were surveyed to the east boundary, a distance of 1,000 meters. Along the cross lines stations were established at 50 meter intervals by stakes and flagging.

GEOLOGY

Lack of outcrops obviated the possibility of a meaningful geological survey. From the Princeton Sheet (East Half) Map #888, the general geology of the area is shown on a 1 inch to 4 mile scale.

A contact between Coast Range granitic intrusives and Nicola andesitic, tuffaceous and basaltic rocks strikes about 5 degrees east of north for the length of the claim. About the western two-thirds of the area is underlain by granitic rocks. A major fault strikes north northwesterly just west of the claim.

Outcrops observed on and near the claim comprise the following rock types:

Coast Range

Grey medium-grained granodiorite.

Reddish fine-to coarse-grained granodiorite.

Bleached and iron-stained granodiorite with sparse copper staining in and near strong fractures.

Wide zone of highly altered brown sheared granodiorite.

Nicola

Black compact andesite.

Dark green andesite porphyry, altered and highly fractured, epidote in fractures.

Black andesitic rock with light green amygdules.

Light brown highly oxidized and fractured volcanic rock.

GEOCHEMICAL SURVEY

A geochemical survey was conducted over the 10-unit Adriana claim to determine the quantity and distribution of the copper content of the overburden.

Samples of the soil were acquired from the "B" horizon about 30 centimeters below the surface. The samples were bagged and forwarded to Chemex Labs Ltd. and General Testing Laboratories for copper

determination in parts per million by current standard procedures.

The assays of the soil samples are classified as follows for the full claim area:

Assay Cu. p.p.m.	Category	Number of Samples	Percentage of Total
0- 39	Not anomalous	499	89.5
40- 79	Weakly "	34	6.1
80-119	Moderately "	6	1.1
120-159	Strongly "	3	0.5
160-199	Very " "	0	0.0
200-399	Highly "	9	1.6
400 and higher	Very " "	7	1.2
Total		558	100

Nine anomalous zones are summarized as follows:

Anomaly No.	Lines N	Lines E	Length Meters	Width Meters	Max. Cu.p.p.m.	Notes
1	17-18	BL-14	900	200	1480	Open west
2	20-21	BL-8	425	75 to 150	335	Open west
3	16	18-20	100	87	450	Open east
4	21	11-12	60	25	200	
5	17-18	16-17	140	80	86	Between 1 & 3
6	24-25	7-8	375	38	90	Open north
7	14	9	Spot		120	
8	25	BL	Spot		112	Open north
9	11	2	200	25	76	Along pipe line

In addition to the above listed anomalies there are eight small and "spot" assays as shown on the accompanying map #3.

It appears significant that the strong anomalies #1, #2 and #3 are located on ridges or steeply sloping sidehill topography. It is possible that overburden may not be deep on these areas and bedrock exposure not difficult.

A magnetometer survey, previously conducted over the area, indicates that anomalies #1 and #2 lie over areas of low magnetic intensity, a characteristic of some porphyry copper deposits. Anomalies #3 and #5 overlies areas of not so distinct but low magnetic trends. Anomaly #7 is located in an area of high magnetic intensity.

An electromagnetic survey indicates little correlation between indicated conductor zones and the geochemical anomalies. Conductor zones do, however, appear to cross anomaly #1 at two locations.

The extent and strength of the higher copper content in the soil cover over anomalies #1 to #5 warrant additional exploratory investigation.

SUMMARY AND CONCLUSIONS

The Adriana 10 unit claim is 33 kilometers north of Princeton, B.C., and 600 meters east of Allison Lake and Highway #5.

A geochemical survey was conducted on a 100 by 50 meter grid over the claim area. Some sampling was conducted between stations.

As illustrated on the accompanying map #3, high and very high copper anomalies are outlined on the northern portion of the property. Anomalies #1, #3 and #5 extend across the full 1,000 meter width of the property and are open to the west and east. In addition, anomalies #2 and #4 lie parallel and 300 meters to the north.

The main anomalies are along ridges of this upland overburden-covered area and therefore exposing bedrock should not be difficult. There appears to be some correlation between the magnetometer survey, in that the anomalous zones overlie the magnetic lows, except for one spot sample at 14N - 9E.

It is concluded that a detailed geochemical survey should be conducted over the full width of the Adriana claim between grid lines 16N to 21N.

A 25 meter grid appears warranted to detail the anomalous zones and provide target areas for stripping and trenching.

If bedrock is exposed over selected areas the sources and character of the copper mineralization may be mapped and sampled.

RECOMMENDATIONS

It is recommended that the following field programme be conducted over the Adriana property:

	<u>Estimated Costs</u>
1. Between lines 16N and 21N establish a 25 meter by 25 meter grid over the full width of the property,	\$ 1,500.00
2. Conduct a geochemical survey over the detailed grid, and if necessary reduce the spacing to 12.5 meters in selected areas,	5,000.00
3. Over selected areas strip and trench bedrock to expose the source and extent of the copper mineralization indicated in the soil cover,	2,500.00
4. Map and sample the mineralized zones,	1,000.00
5. Office, overhead and supervision,	1,000.00
6. Contingencies,	<u>1,500.00</u>
Estimated Costs	\$12,500.00

Completion time is estimated at 60 days.

Respectfully submitted,

ALLEN GEOLOGICAL ENGINEERING LIMITED
