SUZIE MINING EXPLORATIONS LTD.

Report on the Wasi Lake Project

M B #1 & 2 claim blocks

Lat  $56^{\circ} 15'$  N,  $125^{\circ} 10'$  W Longitude

N.T.S. 94 - C/3

I. INTRODUCTION

A lead - zinc, silver prospect in northern British Columbia is under development by the company. Previous work on the northern part of the mineral claims being held has been described in government and company reports under the name "Beveley Prospect." Extensive trenching and geophysics with limited drilling and tunneling was carried out. Work by Suzie Mining began in 1977 and has extended south of the Beveley workings to the Osilinka River. Some work has been carried out on the south side of the river. The M B #1 & 2 claims were staked in Sept of 1977 and recorded on Oct. 14, 1977. This report describes the results of a preliminary geochemical survey carried out on the claim group during the first two weeks in Oct of 1978.

2. SUMMARY

Geological mapping has been carried out on a good portion of the claims held by Suzie Mining, especially around the areas of known mineralization. Interpretation of this surface mapping has served to illustrate the complexity of the geology caused by folding and faulting but sub-surface information is inferred only by projection. The survey has shown that lead, zinc, and silver mineralization can be related to dolomitized parts of a sequence of limestone which, although of limited thickness, has been cut up by faulting and thickened by folding in such a way that

it is exposed at the surface over the entire vertical range of the property of about 700 metres on the Carol # I & 2 claims on the north side of the Osilinka River. Dolomitization appears to favour the upper portion of the limestone and the mineralization occurs as irregular bodies in the dolomite. Above the dolomite and mineralization an argillite sequence is usually found. Above the argillite lies a thick silicified dolomite breccia unit. Where this rock unit outcrops the other formations can be assumed to lie beneath. The basement rocks are schists, siltstones and quartzites which are exposed at the bottom of the hillside as well as at the top where they have been uplifted on the Camp Fault

In general the geology of the Carie is similar to that at the Beveley. The carbonate units are much the same, however, in detail there are differences, which could possibly be ascribed to lower-grade metamorphism on the Carie property.

Preliminary geochemical sampling has been done over selected sections of the areas under investigation both to the north and south of the Osilinka River. The geochemical sampling done on the Carie ground was by D. Stelling during the 1975 field season. The work on the Beveley property was accomplished during the 1978 field season and the results of this work is incorporated in a Report to Support Assessment Work Recorded on the Carol I, Carol E, Carie E and Carie W Groups<sup>†</sup> by K.C.Fahrni, dated November 15, 1978.

The M B # I and 2 claims were staked to cover the old Weber Property described in the Minister of Mines Reports, and other areas where it was thought that the geology was similar to that found on the Beveley and the Carie Properties. Geochemical sampling was initiated on the M B claims to test the area about the old Weber property and the area west of the Wasi Fault.

### 3. CONCLUSIONS

As the survey was of a preliminary nature of investigation an exhaustive interpretation of these results will not be undertaken until more extensive sampling is completed over a greater portion of this area east of Wasi Creek in order to establish a larger data base for this area. There does seem to be a difference in the geochemical results from this area as compared to results from some of the other areas of investigation.

Although the background and range for lead, zinc and silver are lower in this area as compared to the background and range of the results obtained on the Beveley it is concluded that these results obtained east of Wasi Creek do reflect anomalous situations that should be tested further. These lower results may also be reflective of a lower grade of metamorphism and hence mineralization and the deeper overburden for this area.

### 4. GENERAL CONDITIONS

The Suzie Mining Explorations camp is located at Lat  $56^{\circ}08.6'$  north, longitude  $125^{\circ}02.8'$  west in the Omineca Mining Division of British Columbia. It is reached in 8 km. by a branch road which leaves the Fort St. James - Johanson Lake road at Tenakihi Creek about eight km. past Uslika Lake. The gravel road from Fort St. James has been under going some improvement during the summer of 1978, but the 280 kilometers has many bad sections which limit driving speed so that 10 to 12 hours should be allowed for the trip to the Suzie camp. Travel is normally by 4-wheel drive truck but in summer float or wheel aircraft can land at Osilinka Lake or at the airstrip at the south end of the lake.

The camp has been established on a bench on the north side of Osilinka River with four trailers and three frame buildings, being office, wash,

kitchen and bunk trailers plus extra bunk and storage buildings.

The hillside from the Suzie Camp up to the site of the old Donna camp, about 600 metres higher in elevation, has limited rock outcrop but overburden is seldom more than a metre deep. Very little outcrop is to be seen in the valleys of the Osilinka River and Wasi Creek where the overburden may attain considerable depths in places. There is little outcrop in the area of the geochemical sampling done on the M B claims as described in this report and the overburden is thought to be deeper here than on most of the rest of the property above the valley bottoms themselves. Timber is light with very little underbrush so traversing is relatively easy. The timber types are mainly jackpine benches with most of the slopes being mainly spruce, balsam, jackpine with minor amount of deciduous species. Rock outcrops and old surface workings can be identified on air photos. A set of three orthophotos have been prepared by McElhannay to a scale of 1 : 5000, and this provides the regional base maps for geological and other work.

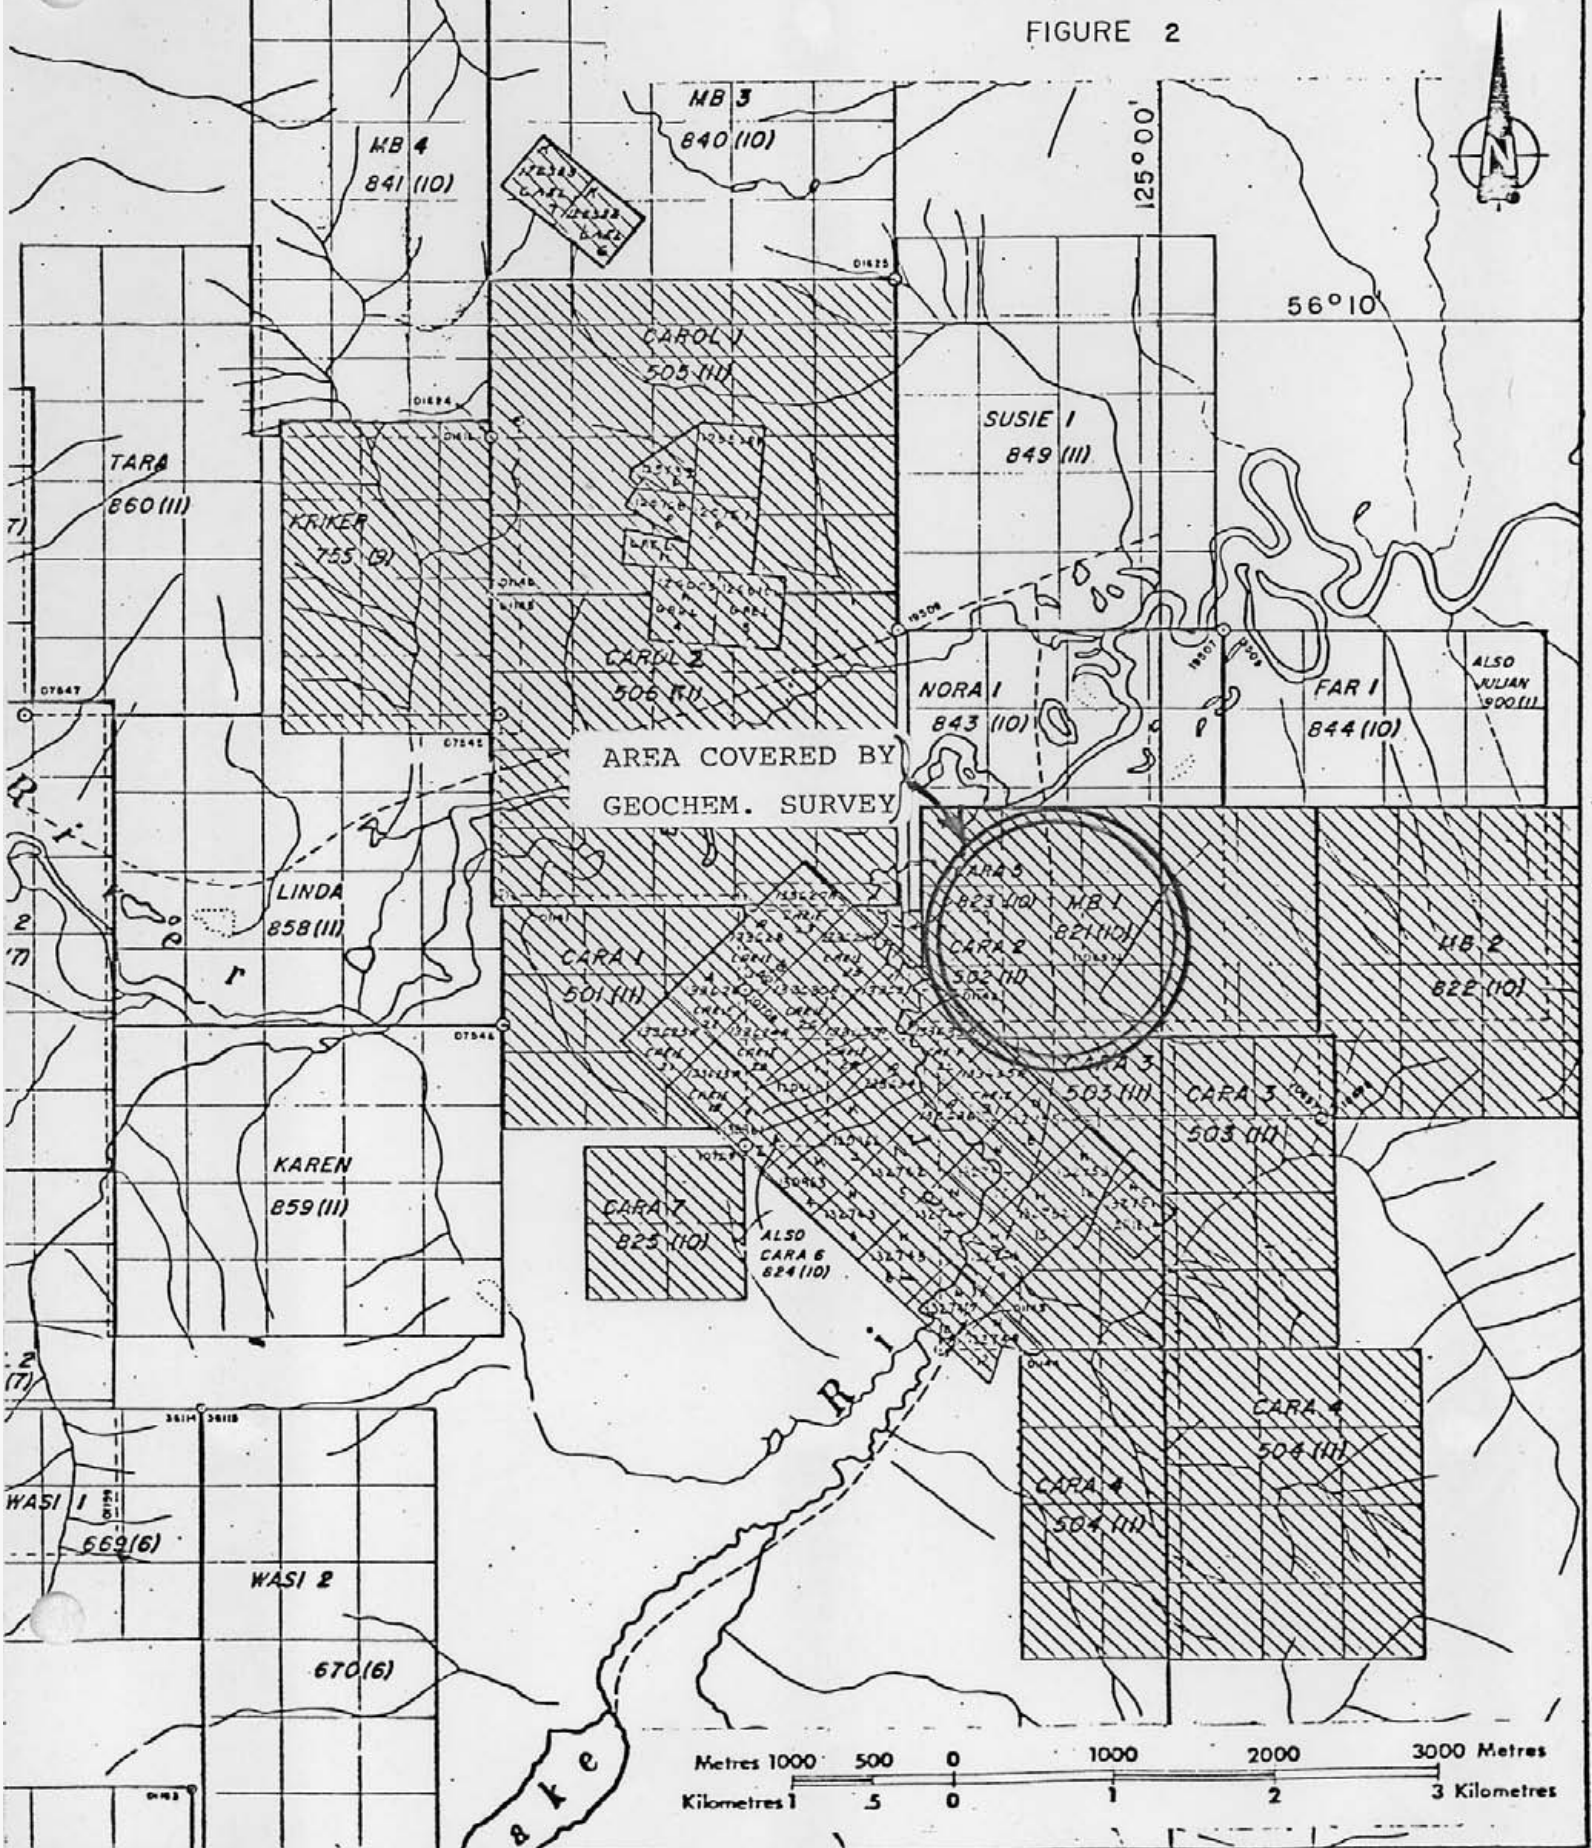

#### 5. PROPERTY

The Suzie Mining Explorations Ltd. holdings consist of a continuous block of ground about three kilometres in width which extends for about six kilometres in a north-south direction. The old showings lie on the Gael Group of eight claims which are held under option from prospector Hall. The rest of the claims held by Suzie have been staked to surround the Gael Group and to cover other showing or geology thought to be similar to that found on the Gael Group. The M B claims lie to the south of the Osilinka River just East of Wasi Creek and cover the old Weber property plus similar carbonate geology.

## 6. HISTORY

The discovery of lead-zinc mineralization dates from 1927 when a prospecting syndicate directed by Cominco were in the area. The early history of the Beveley property is outlined in the Annual Report of Mines for 1952 by McCammon. In 1973 an examination of the workings is reported and the history is updated to that time by Garnett.

Susie Mining Explorations Ltd., formerly Suzie Gold Mines Ltd., obtained an option on the Gael claims which had reverted to R. Hall, one of the original prospecting syndicate members. The Carie, Carol, Cara, Kriker and H B claims were staked to provide an adequate working block. Stelling had found geochemical anomalies on the Carie claims south of the river and in 1977 extensive geophysical surveys were run over about 50% of the ground held by Suzie at that time using gravity meter and EM equipment. Results of an earlier survey of the northern (Beveley) section for Donna mines using Induced polarization and Restivity by Huntec in 1967 were also available. During the summer of 1977 a drill was secured to test some of the more promising anomalies. By fall good mineralization had been found on an anomaly well south of the Beveley showing which has been called the Bullseye showing. During 1978 drilling was continued for part of the spring and late fall on some of the more promising areas of the old Donna showings. During the summer detailed geological mapping was initiated over much of the area north of the Osilinka River. Along with this a controlled line grid was cut over some of the main showings. Soil sampling was undertaken over most of this grid system.

## 7. GEOCHEM SAMPLING AND ANALYSIS

A total of 429 samples were collected on the MB I claim between the 1st and the 13th of October 1978. Four field men plus one supervisor were employed for this survey. Access to the property was by foot from the south side of the Osilinka bridge. Compass and chain lines were run one hundred metres apart with stations every fifty metres along the lines.

Sample sites were dug using a shovel and about one half of a pound of soil was collected and transferred into a standard paper soil sample envelope. Whenever possible the 'B' horizon was sampled. Field data sheets were kept describing the soil sample and the area around the soil sample site. The soils were then analysed for lead, zinc and silver by Chemex Labs Ltd., of 212 Brooksbank Ave., North Vancouver using their standard analytical procedure for atomic absorption analysis.

The results were then plotted on separate map sheets for lead, zinc and silver. The results were contoured and anomalous zones were outlined. The basis of the anomalous condition was established from a visual and interpretative examination of histograms that were plotted for each of the metals. The histograms indicated a background for lead in neighbourhood of 50 ppm with an interpretive anomalous condition of 250 ppm, roughly 5 times the background. The background for zinc is about 150 ppm with the anomalous condition at 800 ppm. The background for silver is less than 0.2 and the anomalous situation at 0.8 ppm. The anomalies for each metal was then plotted on a composite map to outline the coincidence or non-coincidence of the anomalies of the three metals.

8. STATEMENT OF COSTS    Period Oct 1 to 13, 1978

Wages

|                |                            |          |

Statement of Qualifications

D. K. Bragg  
3567 West 27th Ave .,  
Vancouver B.C. V6S 1P9

His qualifications are as follows

Graduated Armstrong High School, B.C. 1951

Attended U.B.C. from 1958 to 1962 in the faculty of Arts and Science , in Honors Geology.

Worked for Keneco Explorations during the summers of 1956, 1957, and 1959 in the Yukon and northern British Columbia as an assistant prospector and as a geochem sampler under the direction of Dr. R. Campbell, R. Woodcock and D. Barr.

Worked as prospector using geochemistry as a field tool during the following years.

- 1960 - Nahani 60 Syndicate in the N.W.T.
- 1961 - Dualco in the central Yukon
- 1962 - Mining Corp. of Canada, south B.C. coast range
- 1963 - Francis River Syndicate in the central Yukon

Worked as field geologist and project supervisor of exploration programs  
1965 - Scurry Rainbow Oil in Greenwood  
1965 - 1967 with Alrae Explorations in B.C. and the Yukon and N.W.T.

Has Recieved the B.C. Provincial Grubstake for the years 1964, 1968, 1969, 1970, and 1971.

Since 1967 has worked on a contract basis in B.C. and the Yukon for many mining companies as an exploration field manager overseeing all facets of the exploration industry, including geochemistry, geophysics, drilling, geological mapping and production mining.

Has worked as exploration manager on the Beveley property since Sept. 1977.

C E R T I F I C A T I O N  
-----

I have read the report by D.K. Bragg dated January 22, 1979, which deals with the geochemical survey of M.B. Claim Group, Omineca M.D. of B.C., Lot 56<sup>o</sup> 10'N Longitude 125<sup>o</sup> 00'W NTS 94C/3 W & 94C/2E. I am satisfied that the work has been properly and correctly done and organized and that the expenditures listed are legitimate.

Yours truly

  
Keith C. Fahrni, P.Eng.
