GEOCHEMICAL ASSESSMENT REPORT

MOLY 1, 4, 5; ANTON 1-6 CLAIMS

SLOCAN MINING DIVISION

INTRODUCTION

Location

The Anton property is located in the Slocan Mining Division on Shannon Creek near the northwest side of Slocan Lake.

Access

Access to the property is gained by a good gravel-surfaced logging road which follows Shannon Creek and bisects the property. Access to the upper slopes is limited to a few skid roads which are impassible to vehicular traffic but can be used as trails.

Topography and Vegetation

The topography of the area is rough, typical for this part of B.C., with approximately 3000 feet of relief between valley bottom and nearby peaks. Mature spruce and fir comprise the dominant boreal types to approximately 6500 feet.

SUMMARY OF WORK DONE

Five hundred and four soil samples and 73 rock samples were collected from the property and analysed for molybdenum and tungsten. The work was carried out between May 27, 1979 and June 20, 1979.

## GEOLOGY

The claims are underlain in part by plutonic rocks of the Wragge Creek stock, a complex intrusive of Upper Cretaceous age. In the vicinity of the claims, medium-grained granodiorite and quartz monzonite, and fine-grained leucoquartz monzonite are the dominant species. In contact with the intrusive rocks and underlying the northern portion of the property are low grade metamorphic equivalents to fine-grained sedimentary rocks of the Slocan series. This group is mainly phyllite, with minor units of marble and calc-silicate rock.

## GEOCHEMISTRY

A total of 504 soil samples, and 73 rock samples were collected from the property.

### Sample Collection

Soil samples were taken from the B-horizon, generally 15-20 cm beneath the ground surface. Sampling was done on a grid over areas of known mineralization. In other areas, samples were taken along traverses controlled by chain and compass or chain and altimeter in the case of contour sampling.

Rock samples for geochemical analyses were taken from selected outcrops. These were chip samples of fresh material, averaging approximately 1 kg in weight.

All sample locations were marked on the ground with a field number written on yellow flagging.

### Sample Preparation

Soil samples were oven-dried, sieved and the minus 80 mesh fraction analysed. Rocks were pulverized and the minus 80 mesh fraction analysed.

### Digestion

Digestion of a sample aliquot prior to analyses for molybdenum was accomplished by nitric and perchloric acid. Digestion prior to tungsten analyses was by pyrosulphate fusion.

### Analyses

Conventional colourimetric methods were used to establish the concentrations of molybdenum and tungsten.
