SUMMARY

Approximately 600 soil samples from IRK 7, 8, 9, and 10 claims near Parrott Lakes, B.C., were collected and analyzed for Cu, Pb, Zn and Ag during June and July 1979. This work served to delimit a large Zn-Pb-Ag anomaly, portions of which also occur on the IRK 1 through IRK 6 claims. If it is determined that the anomalies do not simply represent high background values in one type of volcanic rock outcropping on portions of the IRK claims, further work in the form of percussion drilling to find the source of the anomaly is warranted.

LOCATION AND ACCESS

The Parrott Lakes Prospect is located about 10 miles SE of Houston, B.C., near $54^{\circ}12'N$ - $126^{\circ}38'E$, in 93L/2E, Omineca Mining District.

Elevations range from 2800' to 4200' above sea level, in an area of heavily forested, low-rounded hills.

WORK DONE

Four men spent a total of 20-man days sampling the IRK VII, VIII and IX claims. An additional five-man days were spent soil sampling the IRK X claim.

Cost of carrying out the geochem surveys on IRK VII, VIII, IX and X claims is itemized in APPENDIX "A".

GEOLOGY

The reader is referred to an earlier report by D.G. MacIntyre on the IRK VI claim dated November 30, 1978, for a more complete description of regional geology of the Parrott Lakes area.

Outcrop is very sparse and practically the whole claim area is covered by glacial overburden. Direction of the last glacial flow is believed to have been from west to east.

Andesitic volcanic rocks, mainly tuffs, believed to be part of the Cretaceous Tip Top Formation, are exposed in a few small outcrops on IRK VI claim. A few small outcrops of pyritized, highly oxidized andesitic volcanic rocks, outcrop the northern part of IRK X. The age and correlation of the latter rocks cannot be confirmed.

GEOCHEMISTRY

A total of 480 samples were collected from the IRK VII, VIII and IX claims during May and June. Results on an additional 120 samples collected from IRK X claim at a later time in June, are included in this same report for the sake of completeness of data. All samples were taken from the "B" or "C" soil horizon.

Anomalous and background levels for the geochemical data were determined using probability plots as shown in Figures 3, 4, 5 and 6. Analytical results are given in APPENDIX "B" and plotted on maps included as Figures 7 through 18. (in pockets) Analytical procedures are summarized in APPENDIX "C".

CONCLUSIONS

Statistically, possible anomalous values for soils on the IRK VII, VIII, IX and X claims are considered to be as follows:

Cu	-	greater than	39 ppm
Pb	-	greater than	76 ppm
Zn	-	greater than	450 ppm
Ag	-	greater than	0.8 ppm

Definitely anomalous values are as follows:

Cu	-	greater than	60 ppm
Pb	-	greater than	100 ppm
Zn	-	greater than	550 ppm
Ag	-	greater than	1 ppm

The most important anomalous values for Pb and Ag appear to lie in the central part of IRK VII claim, and on the southern part of IRK X. Cu and Zn show scattered higher readings in the central part of IRK VII and south area of IRK X, but the most common higher Cu-Zn values occur in soils on IRK VI south of the area of the present survey. Some higher values for all four elements are noted on the west side of IRK VII and/or the east side of IRK VIII claim. Future exploration should be concentrated on the latter area and the central part of IRK VII - southern part of IRK X.

APPENDIX "C"

ANALYTICAL PROCEDURES

Geochemical Analysis of Mo, Cu, Pb, Zn, Ag*, Ni, Co, Mn, Bi*, V, Fe, Cd*, & Sb*

Sample preparation

Soil samples are dried at 75⁰C and sieved to -80 mesh.

Rock samples are ground to -100 mesh.

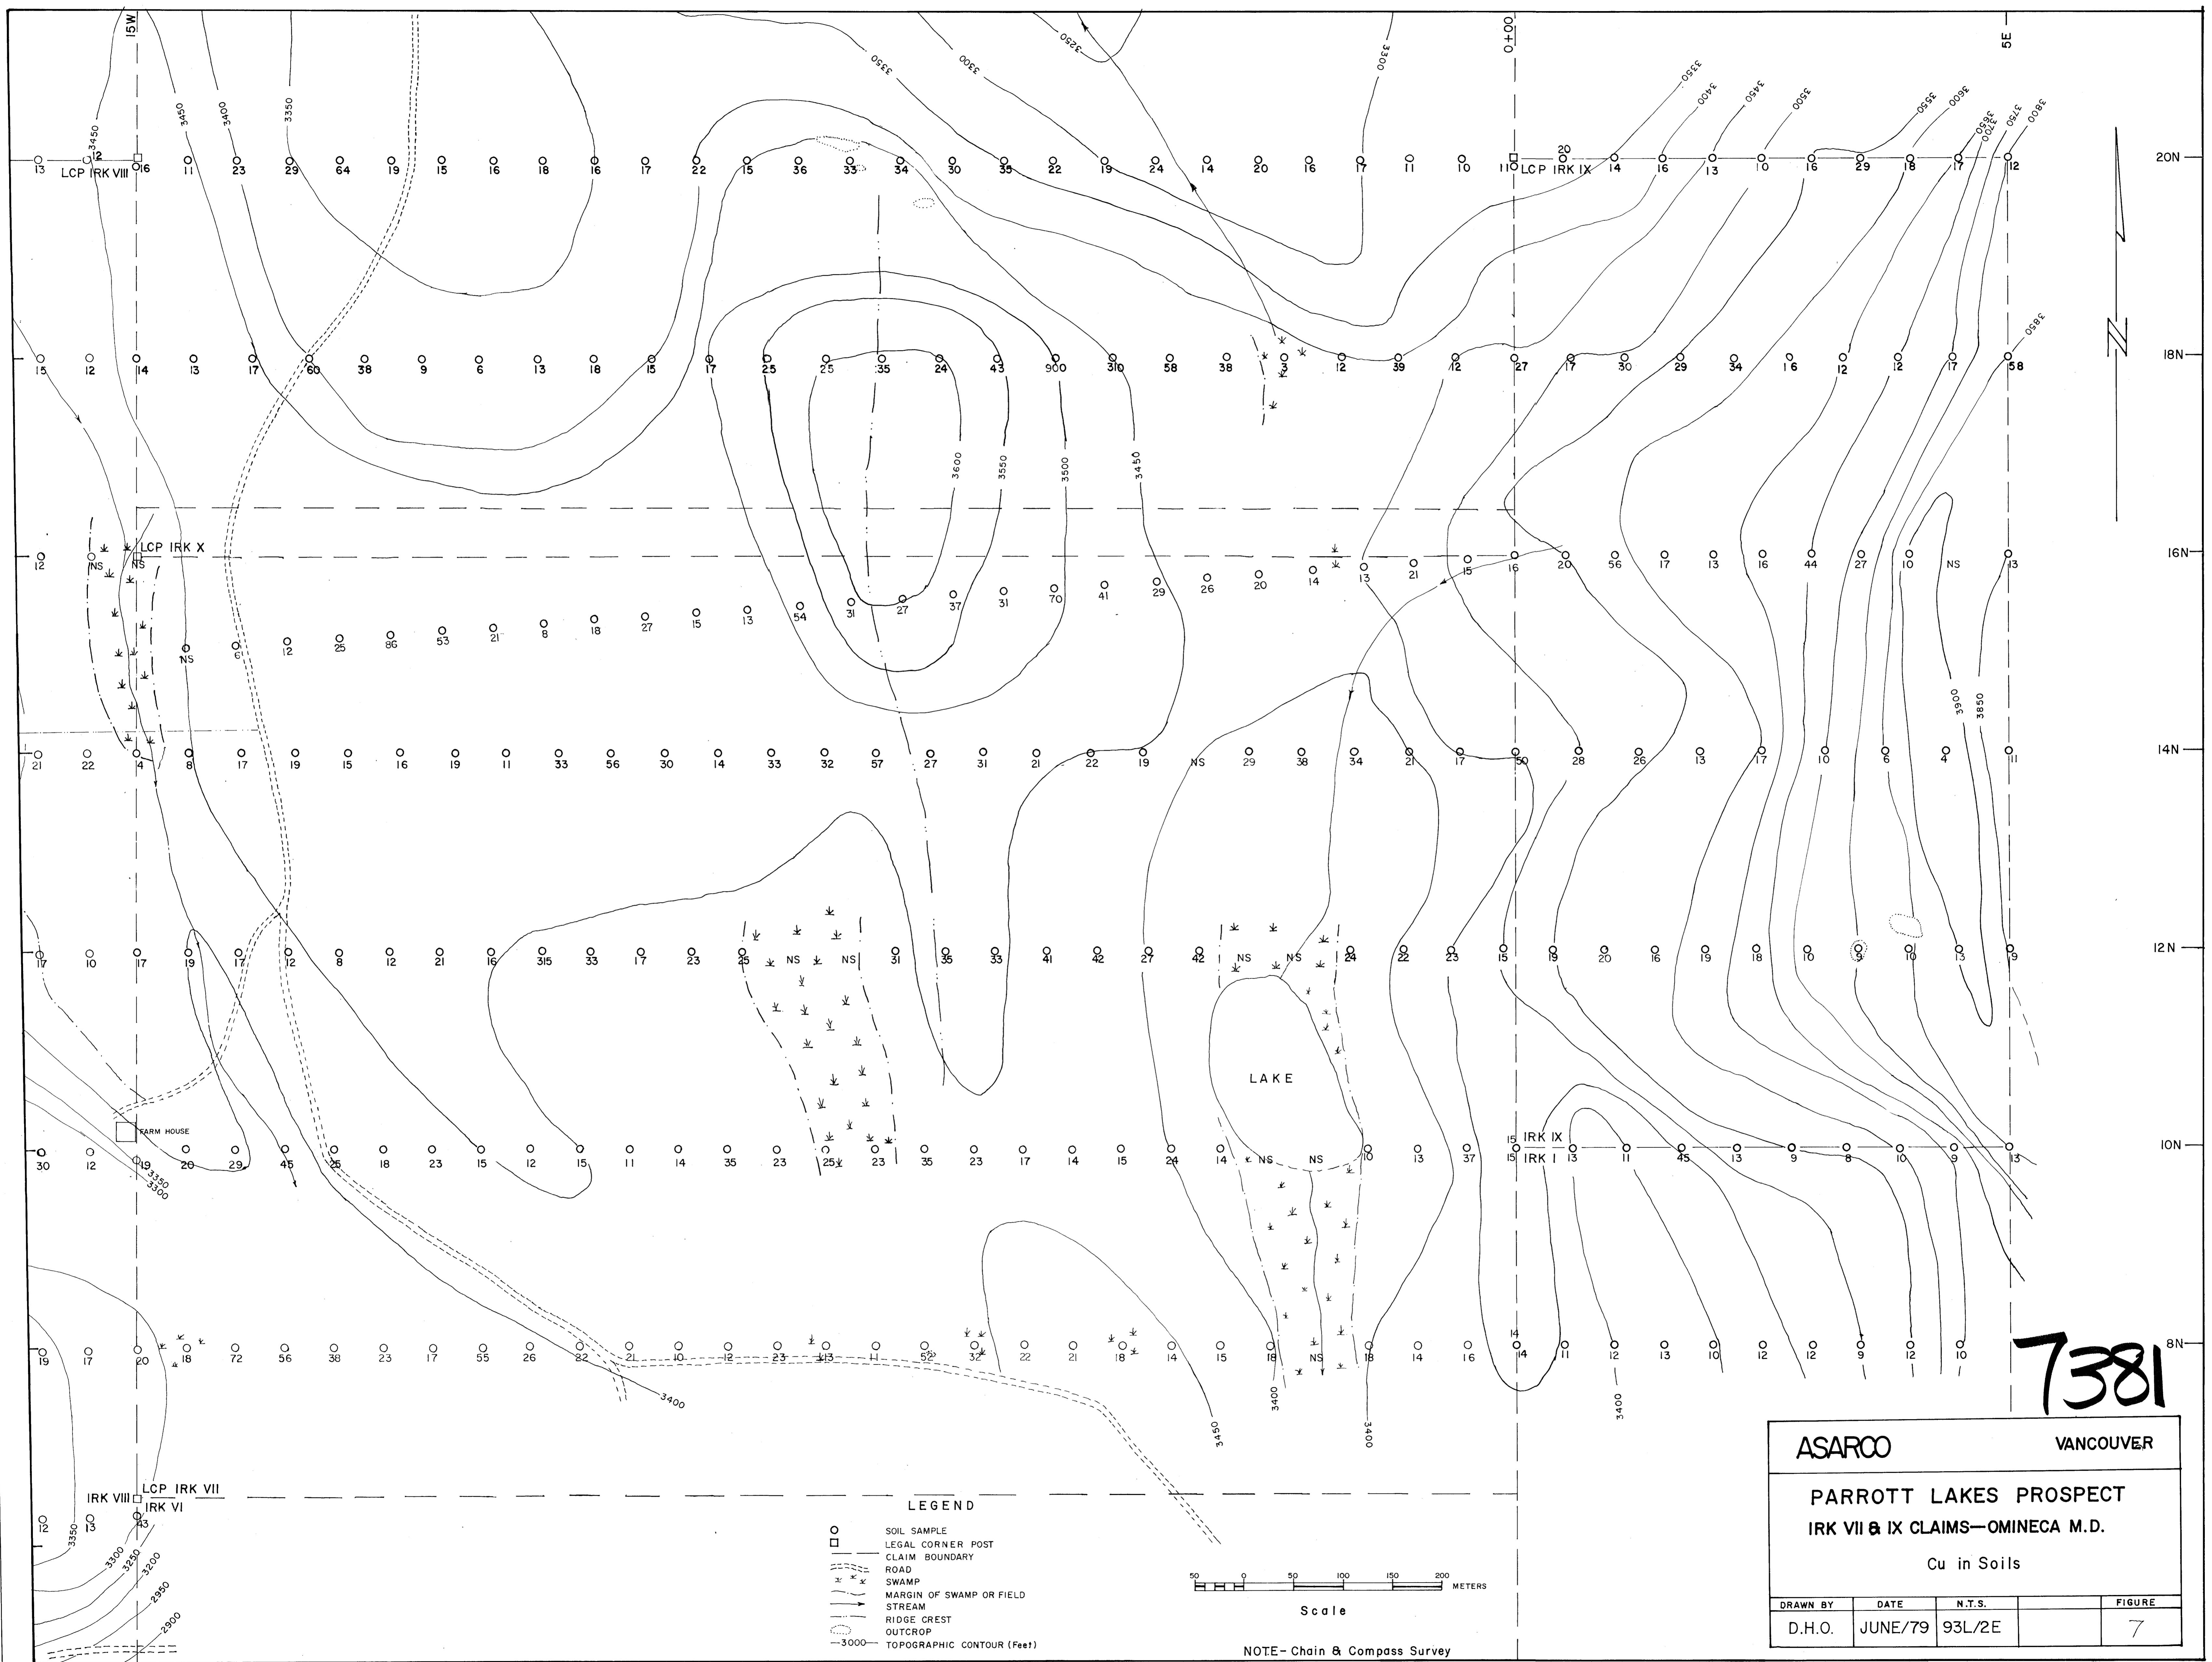

Digestion

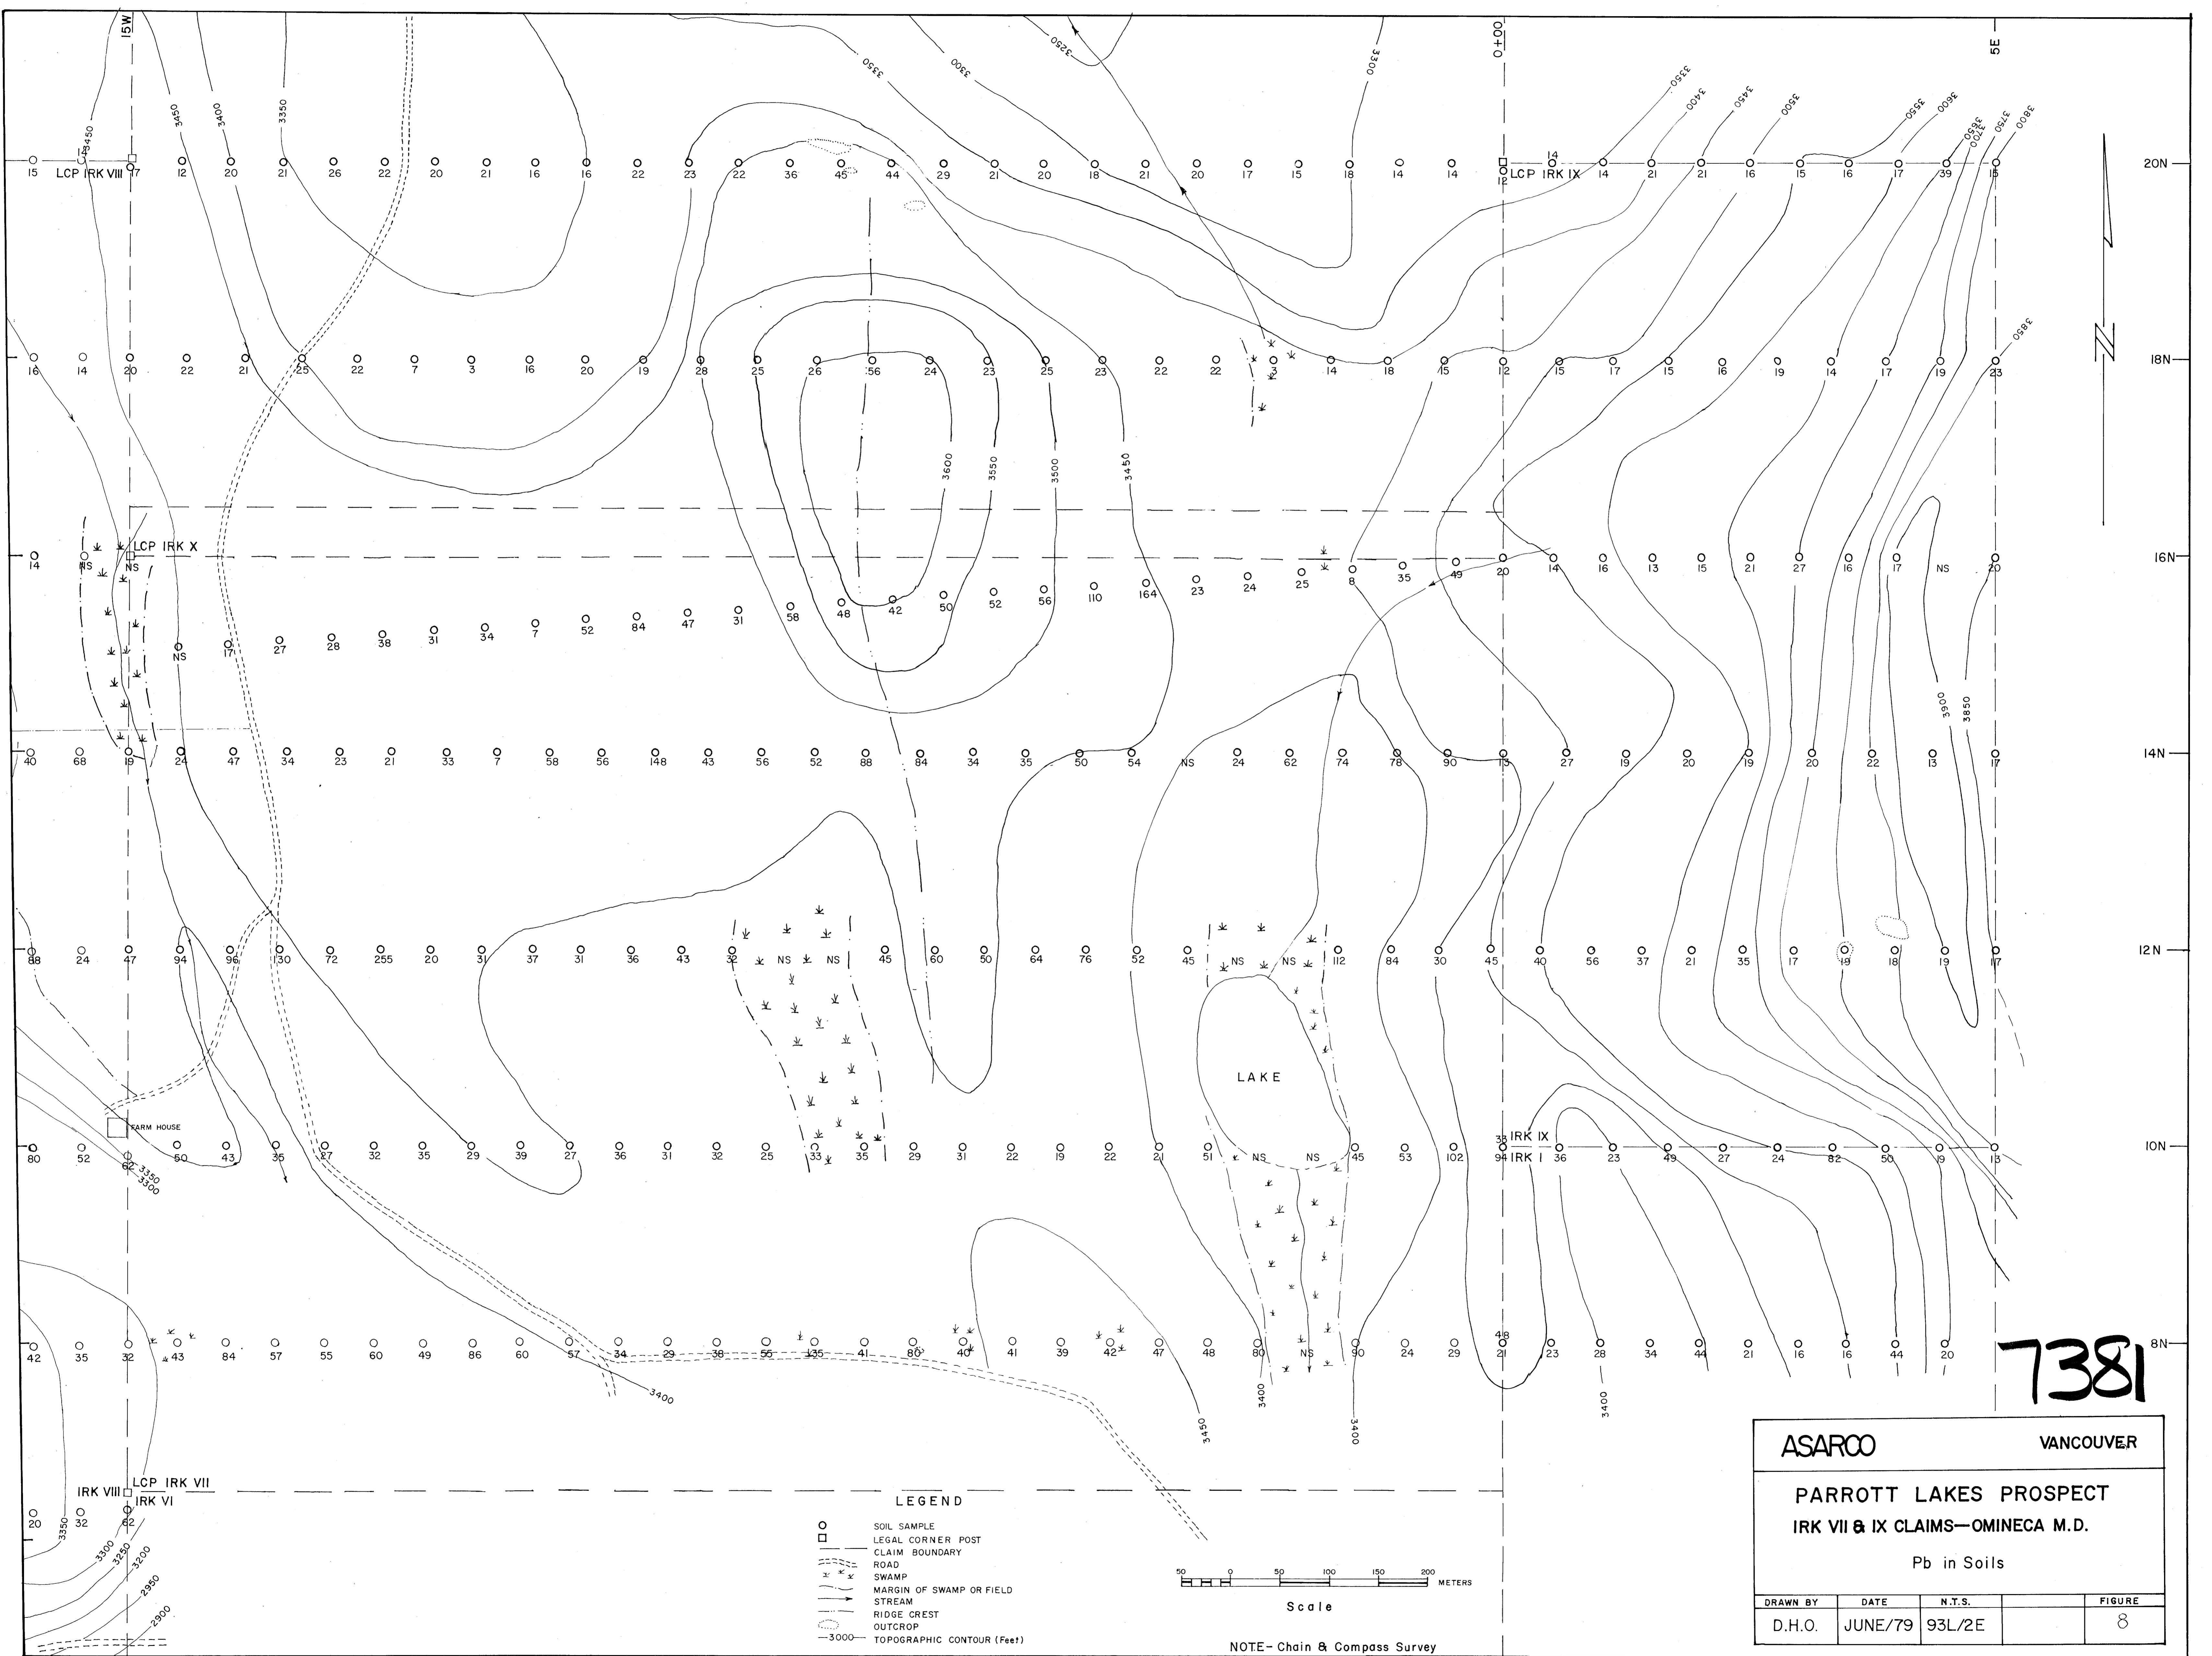

A .50 gram sample is digested with dilute aqua regia in boiling water bath and diluted to 10 mls with demineralized water.

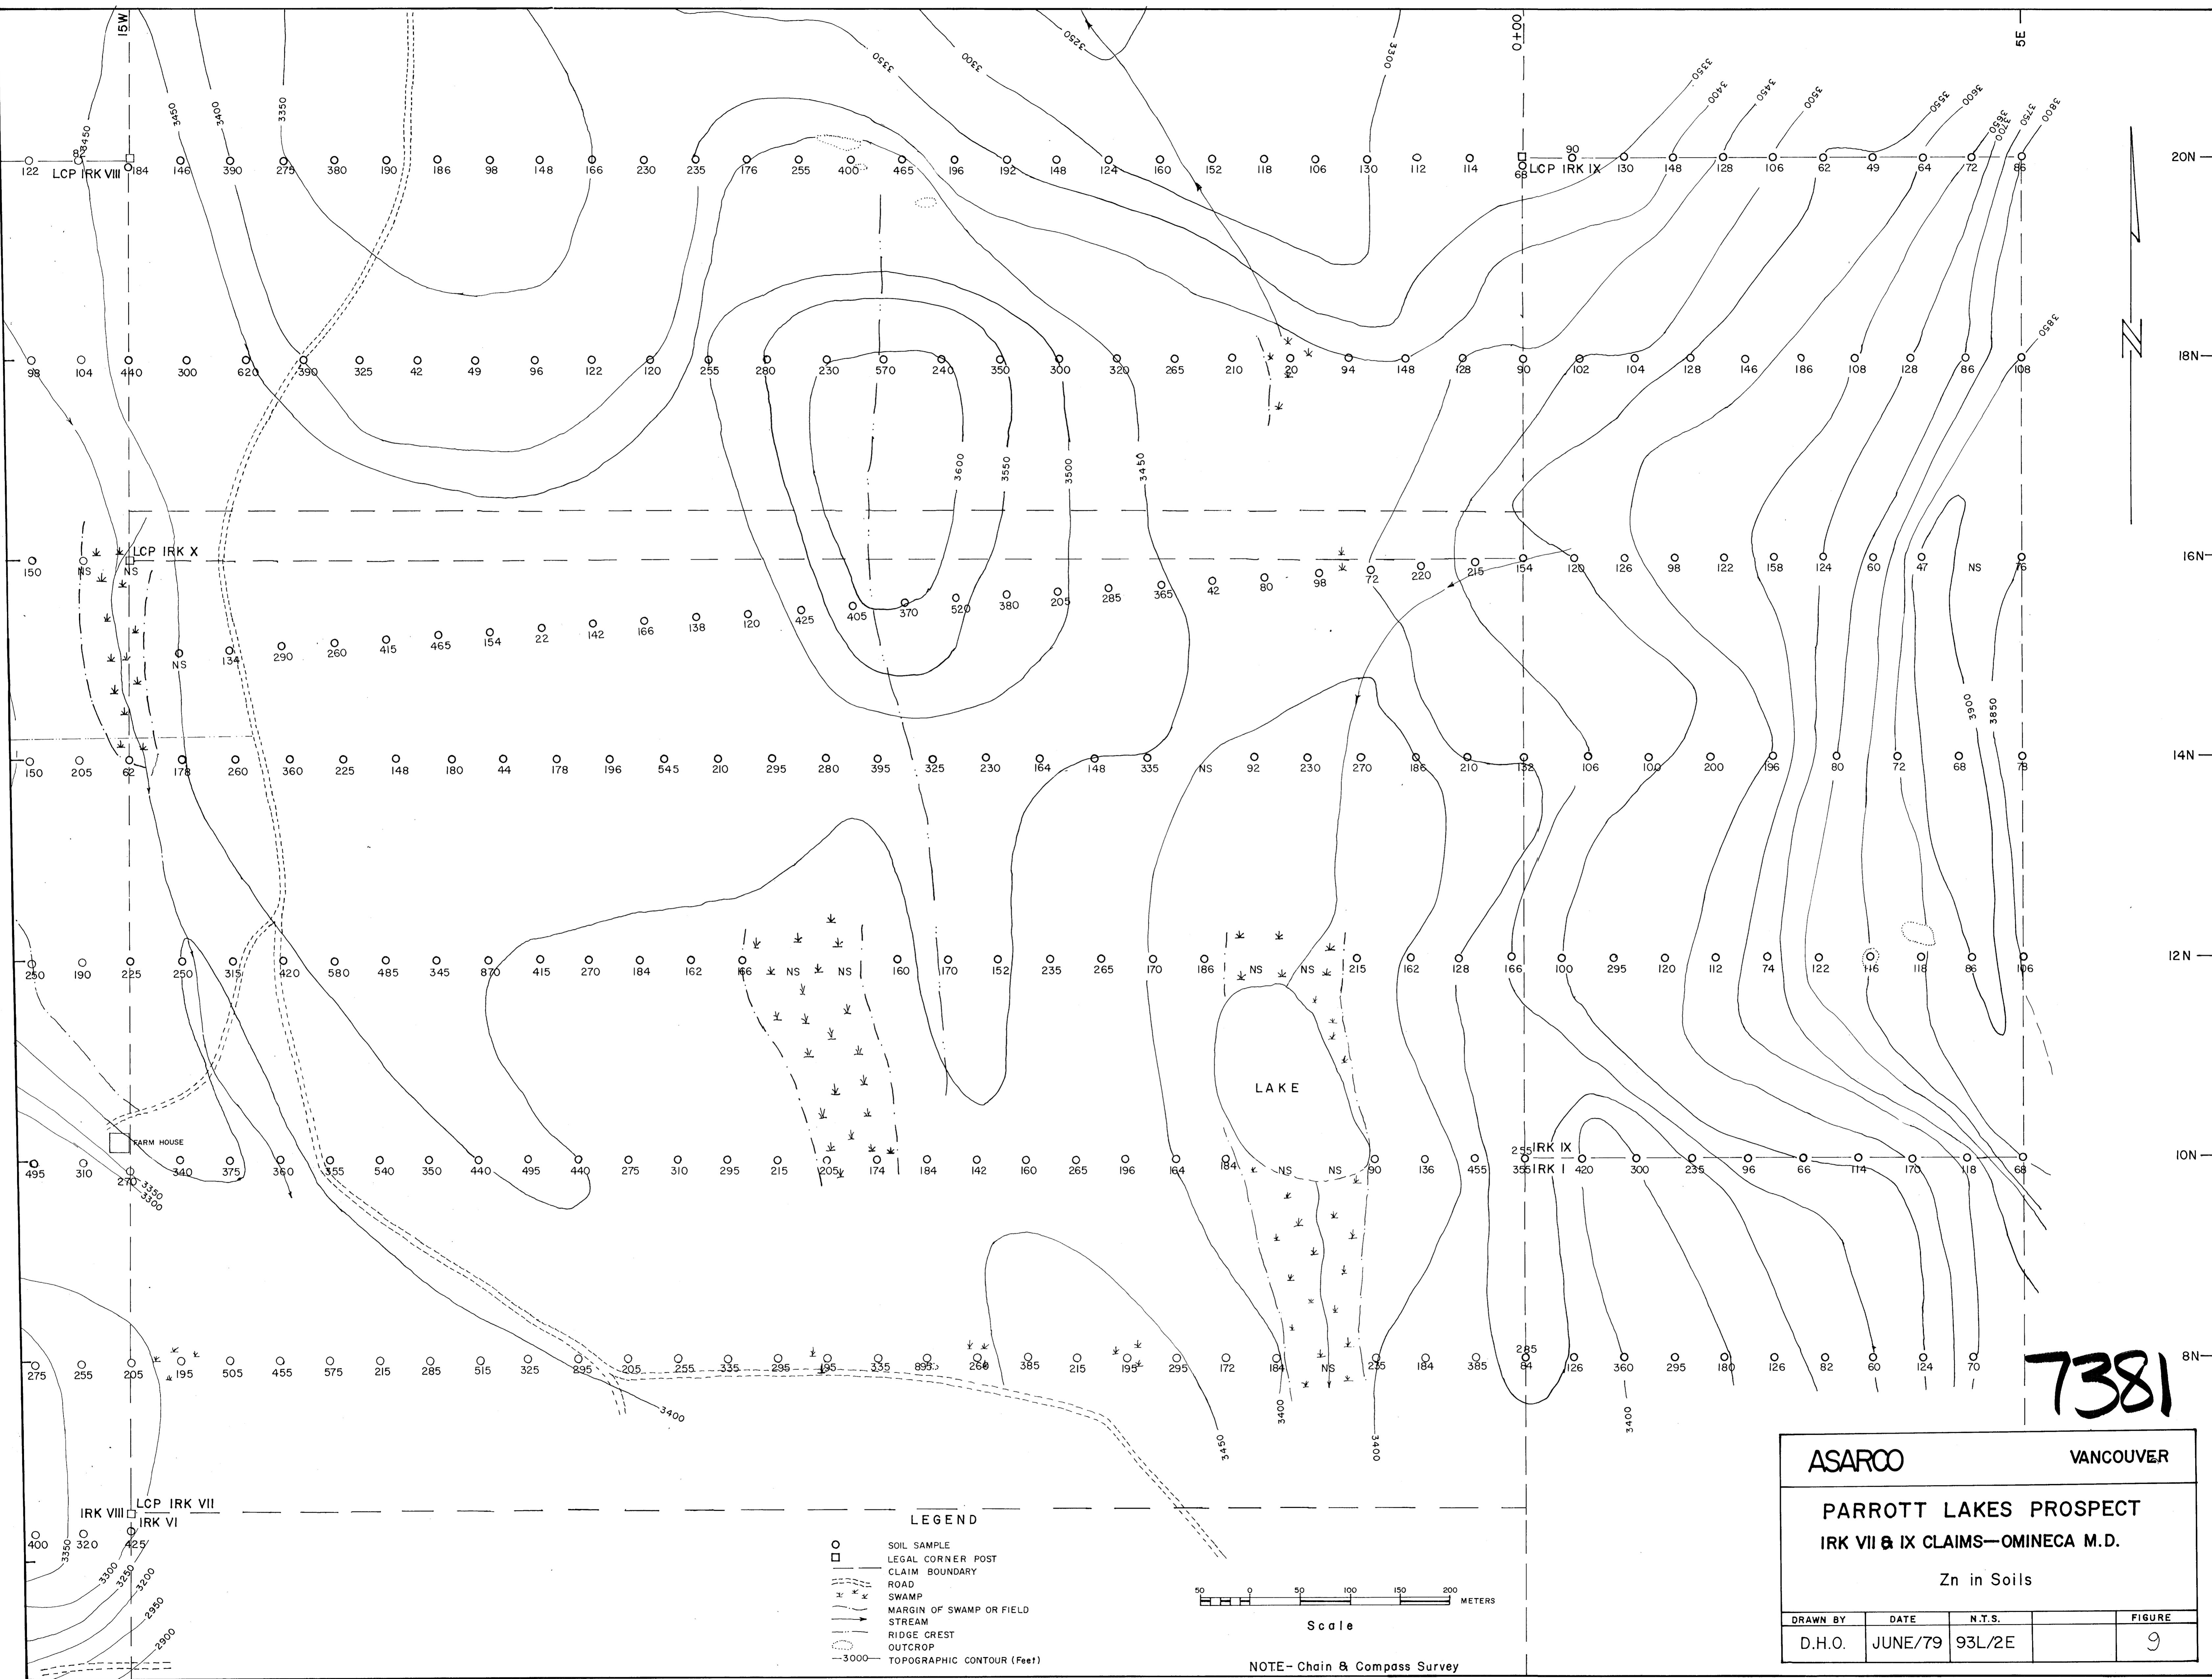

Determination

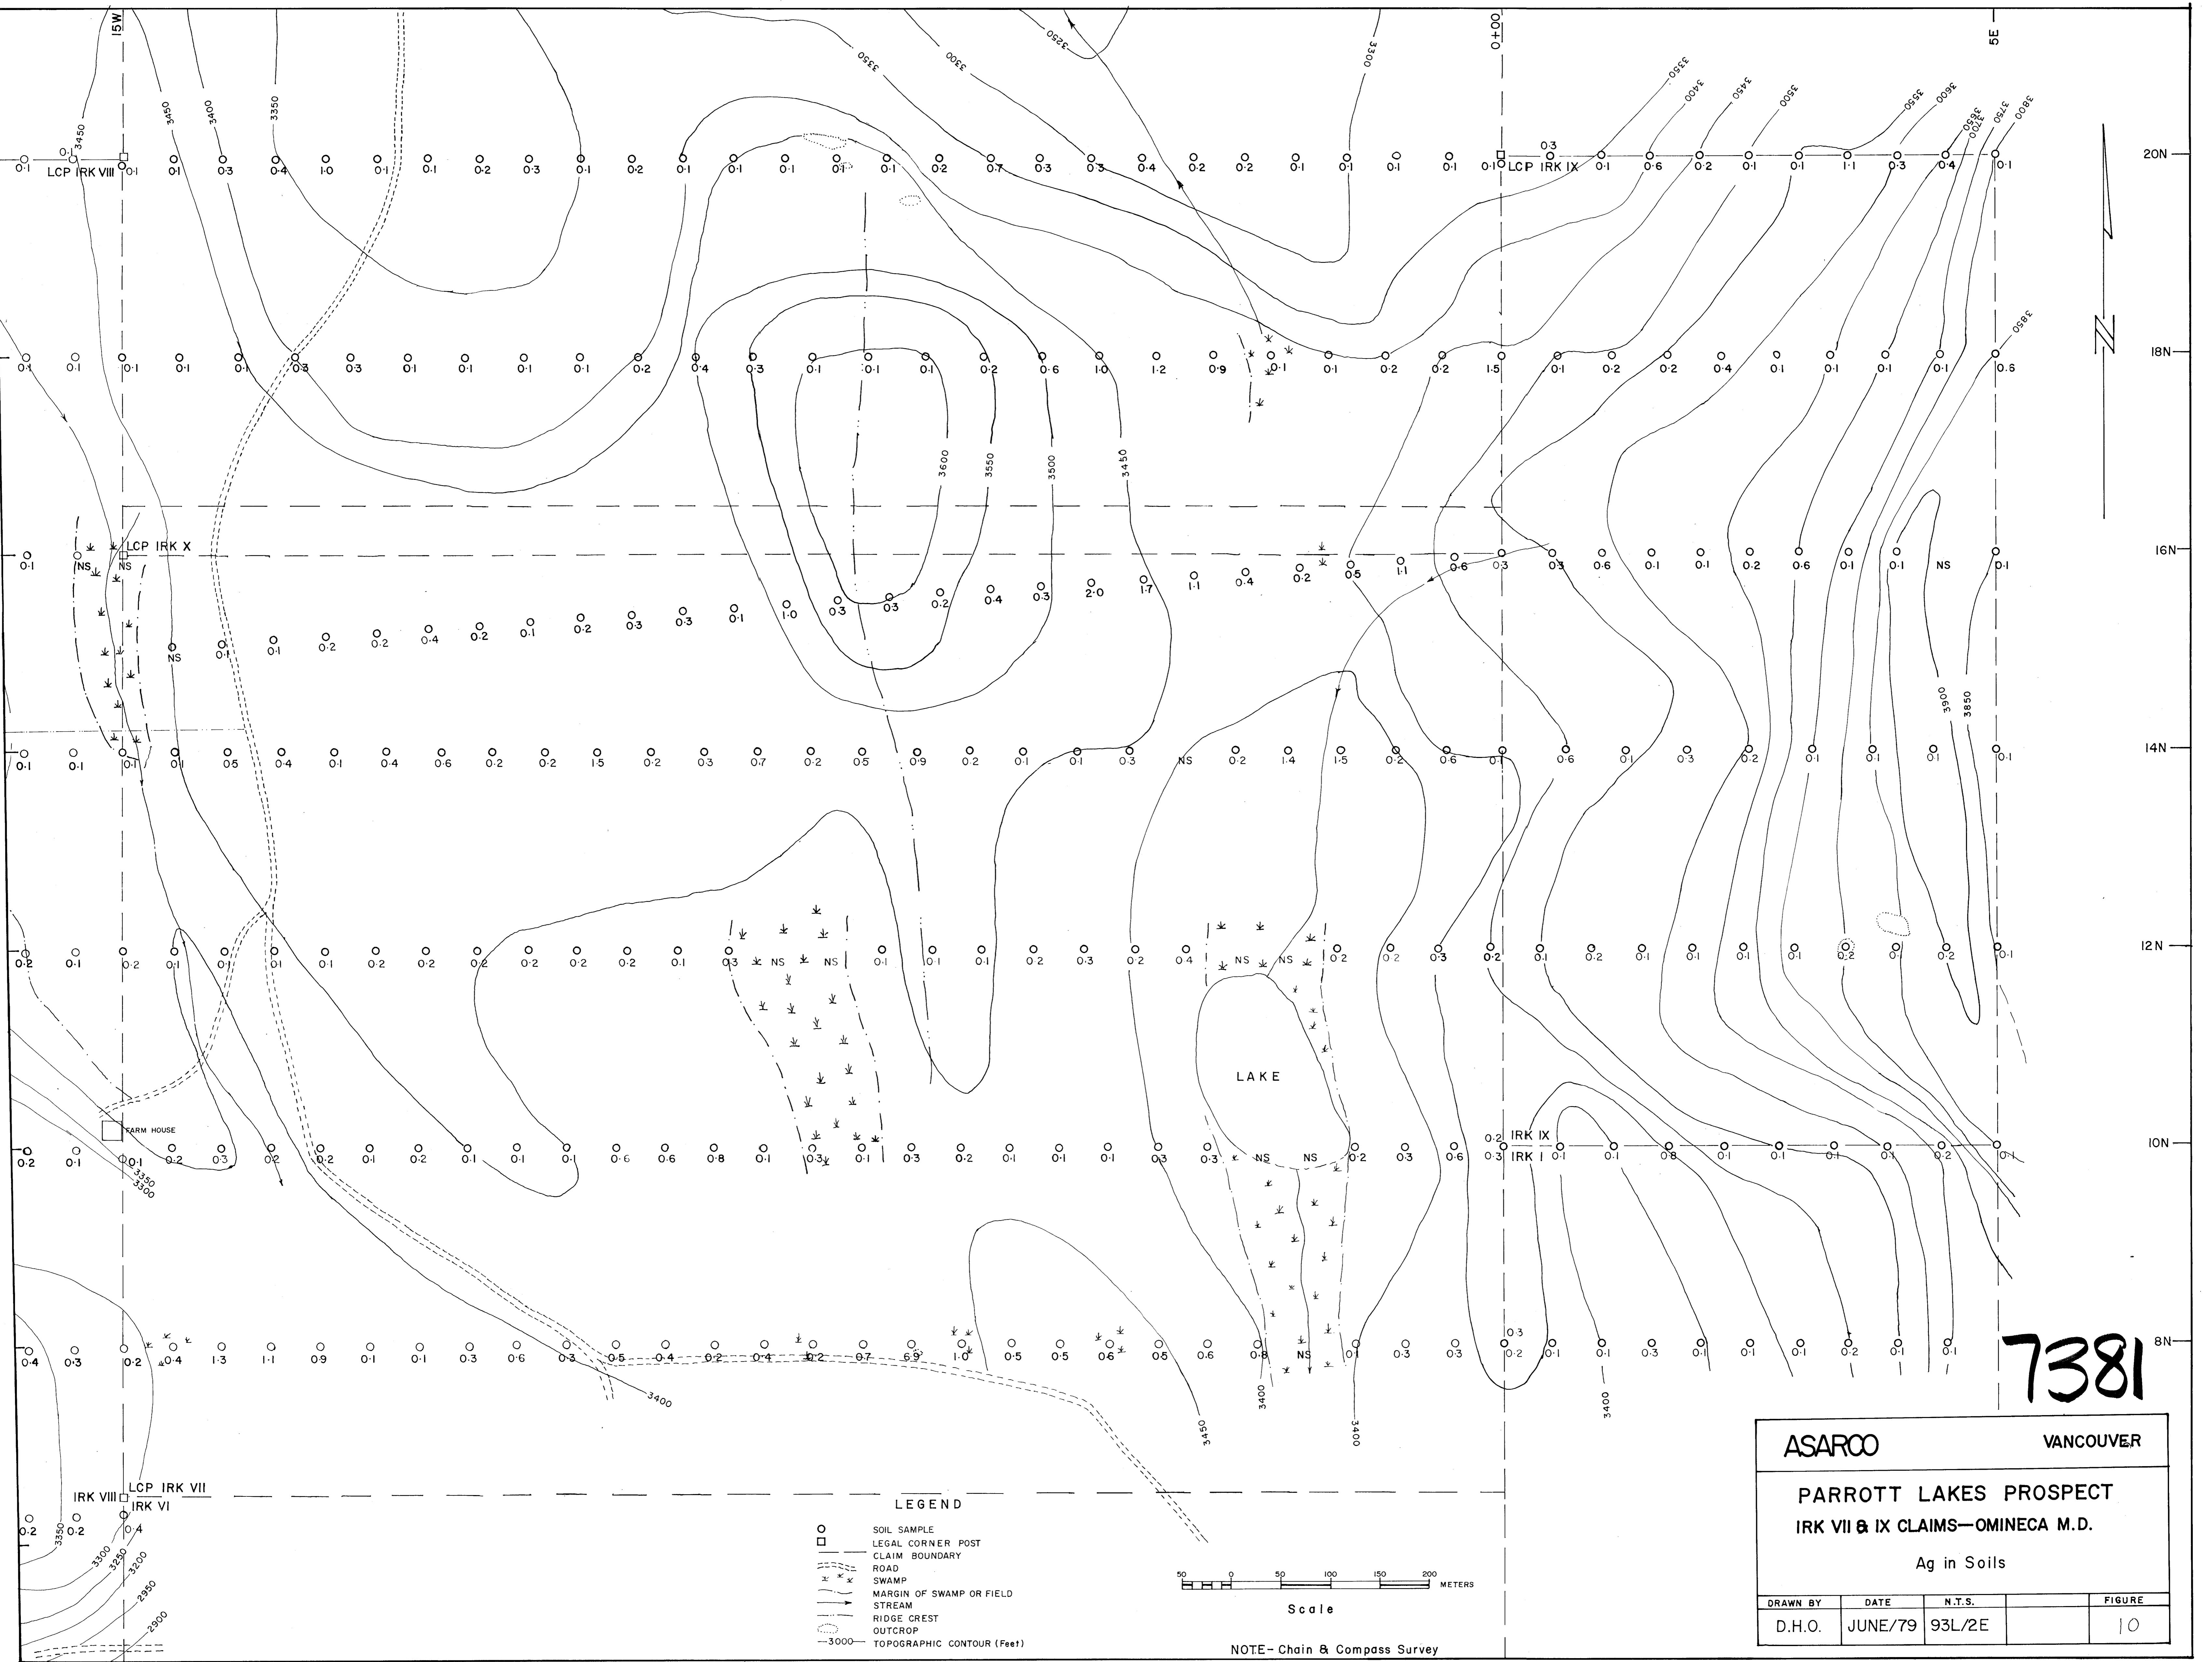

All the above elements are determined by Atomic Absorption from the solution.

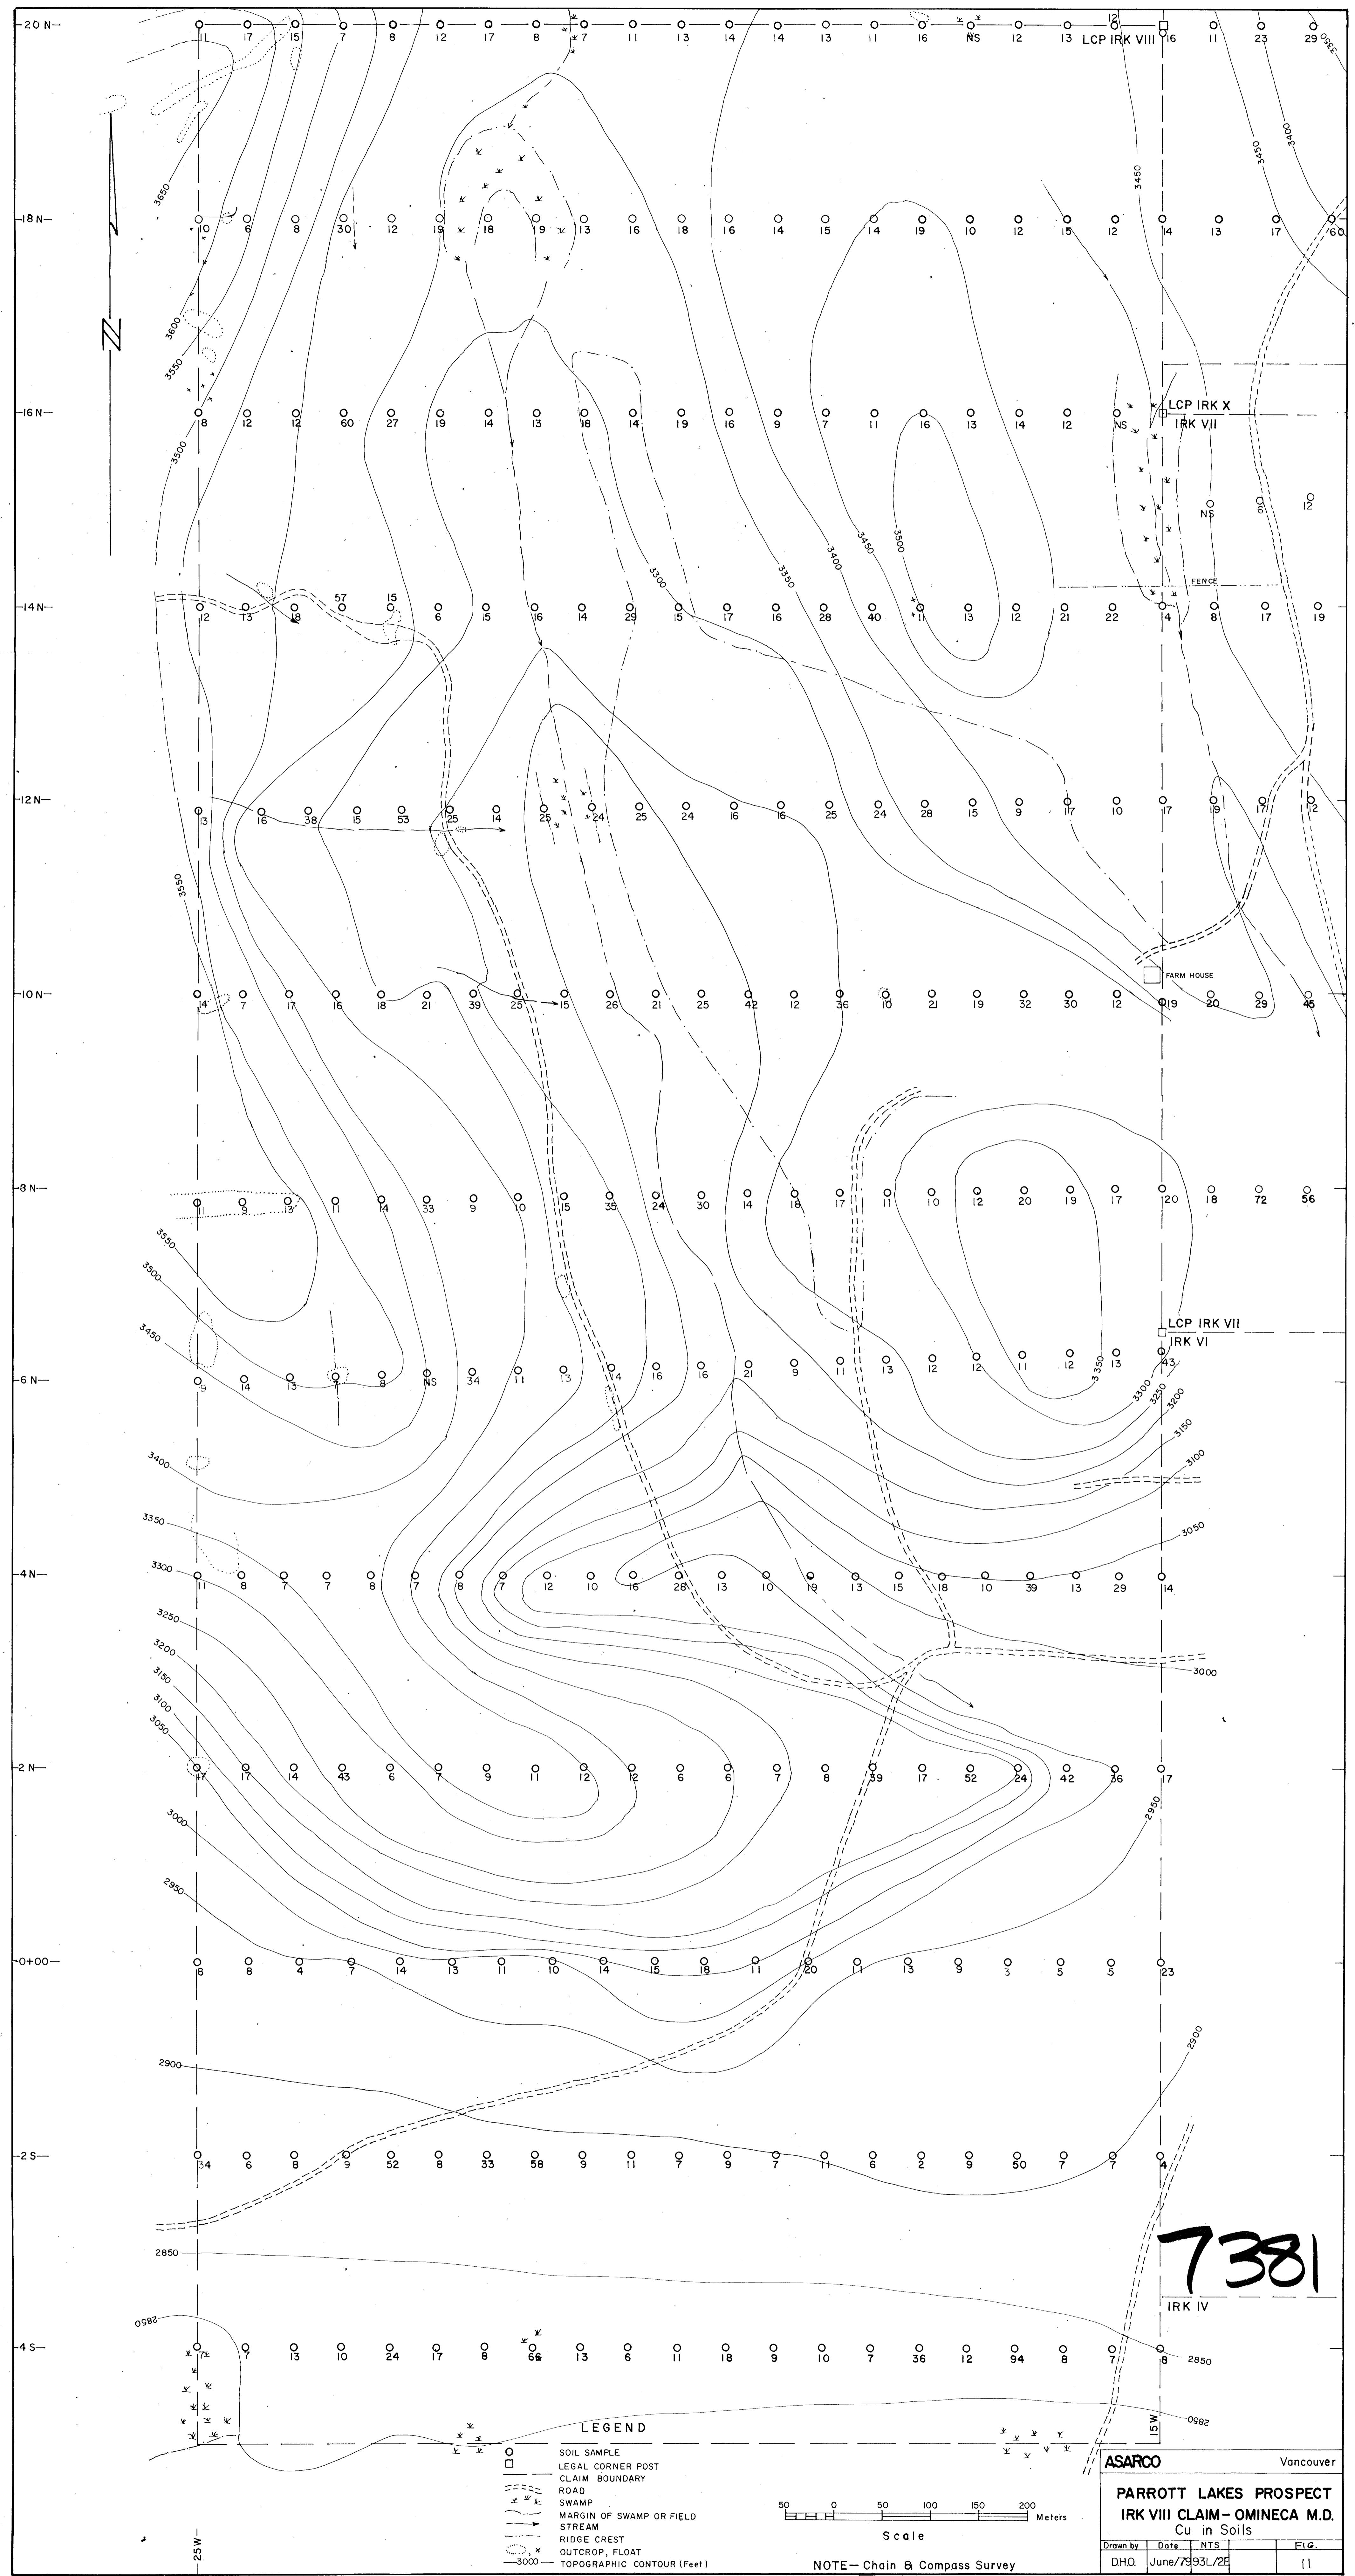

* With background correction.
