INTRODUCTION

The Capoose Project is an exploration joint venture by Scandinavian Minerals Syndicate (SMS) and Bethlehem Copper Corporation. Granges Exploration Aktiebolag, a participant and the manager of SMS, is managing the Capoose Project. The project is located 467 kilometers north-northwest of Vancouver, British Columbia, Canada.

The project contains two separate areas of interest. Widespread Ag values running approximately 45 g/T, with minor Pb, Zn and Au, occur on the "D" and "E" claims. There appears to be a good opportunity for developing ore if enough tonnage can be developed of this grade at present silver prices. Extensive soil geochemical anomalies in Mo and Cu occur approximately 6 kilometers to the west on the Ned, "J", "K", "L" and Ned 1 - 3 Frs. Some percussion drilling and limited diamond drilling have intersected marginal to submarginal values in MoS_2 .

The main effort of the 1979 program was a diamond drilling program completed on the "E" claim, the Ned No. 2 Fraction and the Ned No. 3 Fraction. In addition, a detailed soil geochemical survey for Mo, Cu, Ag and W was completed on parts of the Ned, "K", "L" and Ned 2 and 3 Frs. prior to diamond drilling.

The purpose of this report is to describe the work completed from May 31 through September 14, 1979. The following three

sections in this report and detailed cost statements are included specifically to satisfy Ministry of Energy, Mines and Petroleum Resources requirements for filing this report for assessment purposes.

LOCATION, PHYSIOGRAPHY AND ACCESS

The Capoose Project claims are located in Central British Columbia, 110 kilometers south-southeast of Burns Lake and 110 kilometers southwest of Vanderhoof. The property straddles the Fawnie Range. Slopes are generally very gentle to moderate except along the east and west edges of the Range, and along Green Lake which lies in a steep walled valley cutting through the Range. Elevations range from 1050 meters at the northwest corner of the property at Capoose Lake to 1900 meters along the height of the Fawnie Range.

A winter tractor road connects the property with Plateau Mills' Kluskus-Ootsa road, a distance of 26 kilometers from the end of the road at the northwest corner of the property at Capoose Lake. This road, the Capoose Lake Mining road, can be made passable to four-wheel drive vehicles during winter by plowing off the snow and letting it freeze. During the rest of the year it is only passable to tracked equipment and that usually with some difficulty due to swampy portions along the road. The road distance from the junction of the Capoose and Kluskus-Ootsa roads to Vanderhoof is 150 kilometers.

Another means of access is by float plane to Capoose Lake. Services out of Burns Lake and Tyhee Lake (Smithers) have been used.

From Capoose Lake, a helicopter move is required to reach the various work sites.

Material and equipment can be trucked down the Kluskus-Ootsa road to the Capoose road and then slung in by helicopter. Finally for small loads, such as weekly groceries, there is the option of direct helicopter flight to the job site from Houston, Burns Lake or Vanderhoof.

HISTORY AND PROPERTY DEFINITION(Claims)

Granges' interest in the Capoose area dates from 1973 when part of a regional geochemical silt sampling program revealed anomalous values in Mo, Cu, Pb, Zn and Ag there. Rio Tinto held the area at that time so no action was taken. Rio Tinto allowed their claims to lapse and Granges Exploration staked their first claims in the area in 1975. From 1976 through the winter of 1979 a considerable amount of work was completed. Beginning with grass roots type programs (soil geochemical surveys, magnetometer surveys, geologic surveys), the work progressed to more detailed surveys, as above, and some prospecting and hand trenching. Each year more claims were staked, enlarging the property. During 1978 and the winter of 1979 several percussion drilling programs were completed. The owner and operator of the property, on behalf of SMS and Bethlehem, is Granges Exploration Aktiebolag.

At this time, the possibilities of developing an economic

zone or zones, mainly in silver values, on the "E" claim appear good at the present silver price. Low grade, but theoretically ore grade, has been encountered. The requirement now is to develop tonnage until an ore body is proven.

The situation on the molybdenum area on the western end of the claim block is much less advanced. No economic zones have yet been found.

The property consists of 20 claims totalling 214 units, and three fractions as listed below:

<u>Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Record Date</u>	<u>Expiry Date</u>
Ned	16	67(8)	August 7, 1975	1986
"A"	18	149(9)	September 26, 1975	1983
"B"	18	150(9)	September 26, 1975	1980

SUMMARY OF WORK AND SPECIFIC CLAIMS (Assessment Purposes)

Geochemical Soil Survey on Portions of the Ned, "K", "L" claims,

Ned No. 2 Fraction and Ned No. 3 Fraction:

Baselines and tie lines	6.00 km
Cross lines	<u>26.35 km</u>
Total	32.35 km

Soil samples collected and assayed
for Mo, Ag, Cu and W:

On Ned	36
On "K" and Ned 2 Fr.	278
On "L" and Ned 3 Fr.	<u>260</u>
Total	574

Geochemical Soil Survey on "O" and "P" claims:

Base lines	1.70 km
Cross lines	<u>9.60 km</u>
Total	11.30 km

Soil samples collected and assayed
for Au, Ag and Zn 98

Diamond Drilling on "E" claim:

Nine BQ sized holes totalling 1434.40 meters

Diamond Drilling on Ned No. 2 Fraction:

Two BQ sized holes totalling 228.60 meters

Diamond Drilling on Ned No. 3 Fraction:

One BQ sized hole totalling 124.05 meters

Twelve holes for total of 1787.05 meters

DESCRIPTION OF PROGRAM

Work completed during the 1979 summer program, and described in this report, is as follows. Three new camp sites were prepared and the old wharf was repositioned at the new landing on Capoose Lake. Roads and percussion drill sites completed during the previous winter were slashed. A detailed geochemical soil survey was completed over portions of the Ned, "K" and "L" claims and the Ned No. 2 and 3 Fractions. Five new claims, totalling 47 units, and three fractions were staked. A limited geochemical soil survey was completed over the "O" and "P" claims. A diamond drilling program was completed on the "E" claim, the Ned No. 2 fraction and the Ned No. 3 fraction. After the main program several days were spent on the property completing additional geologic mapping on the "E" claim.

During February and March of 1979, a program of percussion drilling and winter road construction was completed on the Ned, "J" and "L" claims. Slashing of the roads and drill sites was put off until the summer program. During the above program, the winter road was extended to Capoose Lake. Because of swampy ground around the old wharf and heliport on the lake shore, it was not practical to terminate the road there. Therefore the first requirement of the summer program was to move the old wharf to the new landing, build a camp site there and commence slashing along the new road.

Granges personnel left Vancouver on May 31, 1979, to

drive to Smithers, B.C., where Granges' field warehouse is located, and mobilization for the project was begun. On June 2nd an inspection tour of the project was made by helicopter to acquaint the diamond drill contractor with the many aspects and problems to be expected on the project. It was decided that Granges would fly in and construct plywood tent foundations for the required camps and that the contractor, D. W. Coates Enterprises, would provide for every other need related to the diamond drilling program except for helicopter transportation.

On June 4th a crew was flown by Otter to Capoose Lake to move and reset the old wharf at the new landing and commence construction of a new camp site there. On June 5th a crew of five was flown back in to stay. After tent foundation construction and camp set-up were completed, slashing was commenced along the new road. During this time, all materials needed to construct the two additional camp sites were flown in by Otter.

On June 9th a helicopter was used to transport materials and men to the "E" claim where tent foundations were constructed for the drilling program. Also, materials for the new camp site near the southwest corner of the Ned claim were transported to that site.

The crews and equipment of D. W. Coates Enterprises arrived in Vanderhoof on June 13th. On the 14th their equipment was transported via the Kluskus-Ootsa logging road to the junction with the Capoose Lake mining road. On June 15th the drill camp and equipment were moved to the "E" claim using an S-58 helicopter chartered from

Okanagan Helicopters. A 206B Helicopter, chartered from Alpine Helicopters, was used to move the five-man Granges crew, camp and equipment from the Capoose Lake shore to the Ned claim camp site. The 206B also assisted with the drillers' move to the "E" claim. The following day Coates' J.D. 450 bulldozer was driven to the "E" claim over the Capoose Lake mining road.

From the Ned camp site the five-man Granges crew completed the slashing and started the detailed geochemical soil survey. A good baseline was cut by power saw in a north-south direction along line 20W for 1.95 km. This base line was surveyed by transit and all cross lines were turned off the base line by transit. Cross lines and tie lines were run by compass and hip chainer, and marked by blazing and flagging. A total of 5.00 km of base lines and tie lines, and 26.35 km of cross lines was completed. Cross lines were 50 meters apart and samples were collected every 50 meters. A total of 574 samples was collected and assayed for Mo, Ag, Cu and W. The Ned 1 - 3 fractions were staked on June 24th. One of the five-man crew was transferred to the "E" claim to split core on June 22nd. The remaining four completed the soil survey on June 25th and moved out by helicopter and float plane to another Granges project on June 26th.

On the "E" claim, the drill camp set up and first drill set up were completed on June 17th. Two Coates supervisors aided in the move in but left the project on the 17th. The Coates crew consisted

of two drillers, two drill helpers and a cook. Granges personnel consisted of the writer, who was the geologist and manager of the project, and, from June 23rd, A. Montrose who split core. Coates supplied all materials, including food, and equipment, including a J.D. 450 bulldozer on the drill project. Granges was responsible for all helicopter transportation.

Drilling on the "E" claim was completed from June 18th through July 18th, 1979. Nine BQ diamond drill holes totalling 1434.40 meters were completed, (Cap D-1-79 to Cap D-9-79).

Two additional Granges employees were transported to the project on July 14th to assist in staking the "O" and "P" claims and then to complete a geochemical soil survey over them. With the assistance of the two men the writer staked the 3x1 unit "P" claim on July 15th and the 2x2 unit "O" claim on July 16th. The soil survey was completed on July 17th and 18th by D. Martin and C. Sheehan. A total of 1.70 km of baseline and 9.60 km of cross lines was completed. Lines were 100 meters apart and samples were collected every 100 meters along the lines. Lines were done by compass and hip chainer. The area is mostly above timberline and the lines were marked with pickets and flagging. There were 98 samples collected and assayed for Au, Ag and Zn.

On July 19th preparations were begun to move the drill camp and equipment to the south west corner of the Ned claim. The

camp was moved by helicopter on the 20th. Five additional Granges employees were brought in for the day to aid in the move and new camp set up. An Allis-Fiat HD 11 bulldozer was rented with driver to assist in moving the drilling equipment overland to the Ned No. 2 Fraction beginning on the afternoon of July 21st. The J.D. 450 pulled the smaller sloop and the HD 11 pulled the large sloop and drill in tandem. The crew got the equipment to the main road by nightfall and were taken to the Ned camp by helicopter. A crew was returned to the bulldozers the next morning by helicopter and the equipment arrived at the next drill site on the Ned No. 2 Fraction at about 2 p.m. on July 22nd. The HD 11 was then sent out.

Drilling commenced on the Ned No. 2 Fraction on July 23rd. Two BQ sized holes were completed totalling 228.60 meters (Ned D-1-79 and Ned D-2-79). Drilling was completed on July 28th and the drill was moved to the Ned No. 3 Fraction. A 700-meter drill road was completed, using the J.D. 450, from the main road to the Ned D-3-79 drill site.

The writer recorded the "O" and "P" claims on the 27th and returned by helicopter the same day. Montrose was sent to another Granges project on the 27th and the writer supervised the balance of the drilling program.

Hole Ned D-3-79 was completed at 124.05 meters on the Ned No. 3 Fraction on July 30th. July 31st was spent preparing to

move out. On August 1st, two helicopters were chartered from Alpine Helicopters and the camp and equipment were moved out. The J.D. 450 towing the drill skids went out over the Capoose Lake road.

The total diamond drilling on the project consisted of twelve BQ sized holes totalling 1787.05 meters. The core from holes Ned D-1-79 to Ned D-3-79 was left stacked on blocks at the respective holes. On the "E" claim all ore grade sections of core were removed to the company's warehouse in Vancouver. The remainder was stacked on blocks at the core shed on the "E" claim.

The B.C. Ministry of Energy, Mines and Petroleum Resources agreed that Dr. Neil Church, geologist, would aid in the geologic interpretation of the area along the top of the Fawnie Range. This area includes the mineralization drilled on the "E" claim. On August 19th the writer, with Dr. Church and his assistant, flew by helicopter to the "E" claim camp site. The core was inspected by Dr. Church. Eighty-one boxes of core, approximately 520 meters, were prepared for shipment to Granges' Vancouver warehouse. This core was moved to the Kluskus-Ootsa road by helicopter and on to Vancouver in the company truck. Several days were spent in geologic mapping. Dr. Church covered a large area while the writer concentrated on and around the zones of interest on the "E" claim. This crew left by helicopter on August 25th.

On September 9th K. Taylor with a crew of three men returned to the Capoose Project and staked three additional claims. The crew returned to Smithers on September 13th and the "R", "S" and "T" claims, totalling 40 units, were recorded on September 14th, 1979 (see Figure 1). This concluded work on the Capoose Project for 1979.

ASSAYER and METHOD of ANALYSES of SOIL SAMPLES

Acme Analytical Laboratories Ltd., of 852 East Hastings St., Vancouver, B.C., completed all assaying for the project.

All soil samples were obtained from the upper "B" horizon at an average depth of 0.3 meters with the use of augers. The samples were placed in kraft soil envelopes for delivery to the lab. The samples are dried for approximately 16 hours at 75° centigrade and sieved to -80 mesh. For Cu, Mo, Zn and Ag, a 0.5-gram sample is digested with diluted aqua regia in a hot water bath for one hour and diluted with demineralized water. The determination is by atomic absorption from the solution. The Ag is determined by atomic absorption using a background correction. For W, a 1-gram sample is fused with KCl, KNO_3 and Na_2CO_3 flux in a test tube, hot leached overnight, and then made up to 10 ml with water. An aliquot is used to develop a complex with SnCl_2 in HCl and KSCN which is extracted by n-tributylphosphate and carbon tetrachloride. For gold a 10-gram sample is ignited overnight at 600° centigrade. It is then digested with hot diluted aqua regia

and the clear solution is extracted with methyl isobutyl ketone. The determination is done by atomic absorption from the methyl isobutyl ketone extractant with background correction.

DESCRIPTION OF RESULTS

Geochemical Soil Survey on Ned, "K", "L", Ned 2 Fr. and Ned 3 Fr. for Mo, Ag, Cu and W:

No anomalous values in Cu were obtained from the survey. The few low order and scattered anomalous results in Ag and W are not considered to be of interest.

The survey was completed to obtain more detailed data over a previous soil survey done on a 100 by 100 meter sample spacing which disclosed interesting but disconnected anomalous zones in molybdenum. This survey covered one large area and three small areas to the northwest. The small areas were done to detail isolated small anomalies away from the more generally anomalous area. Results on Mo and Ag are shown on Figure 3, and results on Cu and W are shown on Figure 4, both enclosed in the back of this report.

The highest value obtained for Mo was 370 ppm. Several other high values are scattered over the survey area. The contour interval on Fig. 3 for Mo has been doubled from 10 ppm, that is, 10, 20, 40, 80 and so on. The anomalous areas are still mostly disconnected at the 10 ppm range. The anomalies display a strong alignment which suggests that the mineralization is controlled by fault zones. One alignment of anomalies trends north-south for some 1400 meters through

the largest survey area. This anomalous trend is offset at 11-S, 21-W which may indicate that the zone has been displaced by faulting. A second weaker trend runs northwest across the large area and is aligned with anomalies disclosed on two of the small areas to the northwest. The best assay results from the three diamond drill holes, in this area, were obtained within very gougy fault zones.

Geochemical Soil Survey on "O" and "P" for Au, Ag and Zn:

No anomalous values were returned by the survey. This survey indicates that the Zn anomaly extending well south into the "F" claim has been effectively delineated. Results are shown on Figure 5 enclosed at the back of this report.

Diamond Drilling Program on "E" Claim:

The diamond drilling program was carried out to test areas on the "E" claim on which previous work had indicated significant quantities of gold, silver, lead and zinc mineralization. Appendix A contains the logs and records (assays) of the individual holes. The location of the holes relative to the grid and claim boundaries may be seen on Figure 2, enclosed in the back of this report.

The geologic setting along the Fawnie Range consists of a volcanic pile of andesitic and rhyolitic rocks belonging to the Hazelton Group. Within the area of interest, the rock types are predominately rhyolite tuffs and breccia with very minor units of andesitic tuff and breccia. The host rocks for mineralization are rhyolitic tuff and breccia.

The diamond drill results are considered very encouraging.

Several holes returned low grade but significant values in silver over long intersections. Very minor gold values are present. Lead and zinc values tend to be too low to be of interest except for very low values in two holes. The more interesting results are tabulated below:

Hole No.	Intercept <u>Meters</u>	Length <u>Meters</u>	Au g/t	Ag g/t	Pb %	Zn %
Cap D-1-79	15.24-144.48	129.24	.23	50.6		
Cap D-2-79	72.00-79.50	7.50	.32	45.9		
Cap D-3-79	33.0-69.0	36.00	.72	105.9		
"	30.0-143.42	113.42	.33	47.0		
Cap D-4-79	33.0-45.0	12.00	2.41	17.1		
"	120.0-156.0	36.00	.43	60.6		
"	69.0-156.0	87.00	.32	42.8		
Cap D-5-79	30.0-150.0	120.00	.15	46.3	.26	.39
Cap D-7-79	3.05-30.0	26.95	.80	47.8		
Cap D-8-79	145.25-159.0	13.75	.39	52.5		
"	189.34-200.34	12.00	.41	43.4		
Cap D-9-79	81.0-111.0	30.00	.11	52.2	.14	.17
"	45.0-111.0	66.00	.18	36.6	.24	.17

A zone has been indicated which trends through holes 1, 3, 4 and 5. It may possibly extend on through holes 7 and 8, but appears to be much smaller there. This zone appears to dip steeply to the east with holes 1 and 5 bottoming in an unmineralized rhyolite dike. Holes 4 and 8, which penetrated the dike, encountered some marginal values below the dike. Therefore, the full extent of the zone may not have been tested by holes 1 and 5. The results suggest continuity of silver values of approximately 45 g/T for a length of at least 300 meters and over a width of approximately 80 meters. Hole 1 indicates that these values persist at least 140 meters in depth. Re-evaluation of the outcrops in the area of Hole 5 suggest that the mineral zone continues for another 60 meters east

and northeast from that hole. Therefore hole 5 may have been collared near the middle of the zone and it may be substantially wider.

Hole 9 shows that significant values occur well outside of the zone described above.

A substantial amount of additional drilling will be required on the "E" claim to adequately delineate and evaluate the mineralization encountered to date.

Diamond Drilling Program on Ned 2 Fr. and Ned 3 Fr.

The drill area lies within the Capoose batholith. The rock types intersected by holes Ned 1 and 2 were relatively coarse-grained quartz monzonite. Ned 3 intersected quartz monzonite and medium-grained granodiorite.

The logs and assay results for Ned 1 - 3 are located in Appendix A and drill hole locations are on Figure 3 enclosed in the back of this report.

Hole Ned D-1-79 was drilled to investigate submarginal values, averaging .02%MoS₂, in percussion hole P-92. A section in Ned 1 from 45.0 - 103.72 averaged .02%MoS₂. Thus the grade was not improved. The last 2.63 meters of the hole returned .1%MoS₂ although it did not look significantly better than other mineralized sections.

Holes Ned D-2-79 and Ned D-3-79 were drilled to

test two interesting molybdenum soil anomalies. Results were disappointing although sufficient MoS₂ was intersected to explain the presence of the soil anomalies. The two holes returned the following sections with MoS₂ values:

	<u>Intercept - Meters</u>	<u>% MoS₂</u>
Ned 2	39.14 - 45.14	0.037
	96.42 - 96.82	0.485
Ned 3	26.52 - 29.57	0.098
	46.59 - 47.08	0.282

With the exception of the .1 assay at the end of Ned 1, better values were associated with highly chloritized gouge zones. These zones display intense lineation and contained, in places, numerous black slips which were originally thought to be mashed pyrite. It appears, from assays, that this black material is, at least in part, molybdenite. In all holes these structures cut the core at low angles, generally from 10° to 30°. Consequently any future inclined drilling should be directed in the opposite direction. Since mineralization appears to be fault control and soil anomalies suggest narrow linear features, any future percussion drilling should be done with fences of closely spaced holes.

Geology - "E" and "F" Claim Area:

Several days were spent, from August 19 - 25th, in re-mapping areas on the "E" and "F" claims. Dr. Neil Church was on the property with the writer during this time, and he made a more wide-ranging reconnaissance geological survey along the Fawnie Range from Fawnie Nose to the southern cliff overlooking Green Lake. He also

devoted some time to the mineral zones on the "E" claim.

Dr. Church believes that all the rock units from Fawnie Nose to Green Lake belong to the Hazelton Group. He found that the average glacial striae in this area are N66°E. The most prominent set of jointing has an attitude of N70°E and dips 85°N. A secondary set strikes N55°E and dips 68°SE.

It was mentioned earlier in this report that the rock types along the Fawnie Range are andesitic and rhyolitic tuffs and breccias. There are only a very few, very limited areas where bedding was found. For the most part, the attitude of these volcanic units has been determined from observed flow banding. It would appear that a very minor portion of these volcanics was deposited in marine environment.

Observed flow banding and bedding along the range averaged N56°E with an average dip of 38°SW. Strikes varied from S22°E to N85°E, and dips from 15° to 46°SW. Locally within the area of interest on the "E" claim the attitude of the flow banding is north-south with a vertical to near vertical dip.

The geology of the zones diamond drilled on the "E" claim is shown on Figure 2 enclosed in the back of this report. It shows that the attitude of the units mapped in that area in general conform to the regional trend. The alteration zones and geochemical anomalies cut across the units in the same direction as glaciation. One

would assume that the geochemical anomalies extending for 3.5 kilometers to the northeast have been caused by glaciation. Dr. Church has postulated that the mineralization probably has been implaced by ascending solutions and/or vapours moving up vertically more or less at right angles to the attitude of the units in the volcanic assemblage. By coincidence this direction is now the same as the direction of glaciation. One cannot disregard the geochemical anomalies to the northeast. In addition the most prominent jointing pattern coincides roughly with this trend.

Alteration in the mineralized zones is mainly silicification. Garnitization, while wide-spread and intense in some areas, can be totally absent in others. In unit 4a, the host for mineralization intersected in Hole D-5, the principal alteration is kaolinization.

The mineralization in and adjacent to unit 4a may indicate a more favourable host rock and thus the spreading out of mineralization from the postulated vertical columnar zone of ascending mineralizing solutions.

The predominant sulphide present in the drill core is pyrite. Very minor amounts of sphalerite were generally present. Only holes D-5 and 9 contained low but significant amounts of sphalerite and galena. Silver values do not necessarily increase with higher lead or zinc assays. A study of polished sections made two years ago suggests that the silver is present as argentian tetrahedrite, pyrargyrite and electrum. Disseminated crystals of arsenopyrite occurred throughout

the core in hole D-9. Minute amounts of chalcopyrite were observed in several holes. Some values are present as oxides in the upper portion of the holes. Assays suggest some enrichment at the base of the zone of oxidation.

COST STATEMENTS

Granges Exploration's accounting records show the following amounts spent in direct work on the Capoose Project from January 1st through August 31st, 1979:

Percussion Drilling	\$ 48,340.53
(not covered in this report)	
Diamond Drilling	193,603.18
Geochemical Surveying	12,689.50
Geological Mapping	<u>2,869.25</u>
	\$257,502.46

Cost statements, below, have been prepared to satisfy requirements for filing assessment on the following groups of claims:

"J", "K", Ned #1 Fr., Ned #2 Fr.

"L", Ned #3 Fr.

"D", "E", "F", "N", "M", "O", "P"

The breakdown of costs on this project is complicated for the following reasons. Transportation costs overlap because the geochemical surveys were being serviced at the same time as the diamond drilling. A significant portion of the drill contractors charges and other expenses on the program can only be related to the overall project and therefore must be apportioned to the several job sites. The drilling contractor's bill has been divided by the total meters drilled and apportioned to each area at that cost per meter. Their billing includes the cost of providing a J.D. 450 bulldozer at \$20/hour (not including operator), and board for Granges' personnel at \$8/meal. A portion of transportation costs was assigned to the geochemical surveys and the larger balance

has been apportioned to the drill areas on the basis of meters drilled in each area. The following figures show the costs that have been apportioned:

Diamond Drill Contractor's Total Bill = \$144,362.53

\$144,362.53
1787.05 meters = \$80.78/meter

Transportation:

Okanagan Helicopters - S 58, June 15th

7.3 hrs. x \$800	5,840.00
Fuel	<u>101.43</u>
Helicopter costs to drill program	\$5,941.43

Alpine Helicopters - Bell 206B and 47T, June 2, 9, 15
18, 22, 26; July 4, 7, 10, 14, 20 to
22, 26-27; Aug. 1

Bell 206B --	46.2 hours	
Less -	5.0 hours apportioned to Geochem survey Ned, "K", "L" area	
Less -	<u>1.0 hour to Geochem "O" & "P"</u>	
	40.2 x \$330/hr	13,266.00
Bell 47T	12.2 x 225/hr	2,745.00
Fuel		<u>1,092.56</u>
Helicopter costs to Drilling Program		<u>\$17,103.56</u>

Smithers Air Service - Otter, June 4, 5, 6, 26

Total billings \$ 2,950.00

1/2 to Diamond Drilling	1,475.00
1/4 to Geochem Survey on Ned, "K", "L", et al	737.50

TOTAL Transportation costs to Drilling Program \$24,519.99

Lumber	\$1,532.77	
Hardware	<u>441.36</u>	\$ 1,974.13

1/4 to Geochem Ned, "K", etc.	493.53
3/4 to Daimond Drilling	1,480.60

Mobilization for Diamond Drilling - H. H. Shear, June 1 - 14

14 days @ \$75.13 =	\$1,051.82
---------------------	------------

Report and Maps - H. H. Shear, Oct. 5, 9-12, 15-7

8 days @ 107.35/day =	\$ 858.80
-----------------------	-----------

1 day to Geochem Survey "D" & "P" claims	107.35
2 days to Geochem, Ned, "K", "L", et al	217.70
5 days to Diamond Drilling	536.75

Apportionment of Cost to Drill Areas: (Total drilling - 1787.05 meters)

Drilling on E claim	<u>1434.40</u>	=	.80266
	<u>1787.05</u>		

Drilling on Ned 2 Fr.	<u>228.60</u>	=	.12792
	<u>1787.05</u>		

Drilling on Ned 3 Fr.	<u>124.05</u>	=	.06942
	<u>1787.05</u>		

Apportionment of Costs on Geochemical Survey:

among "K", Ned #2 Fr. and "L", Ned #3 Fr.

(Total soil samples -- 574)

on "K", Ned #2 Fr.	= 278	--	<u>278</u>	= .48432
			<u>574</u>	

on "L", Ned #3 Fr.	= 260	--	<u>260</u>	= .45296
			<u>574</u>	

The above computations are carried forward into the calculations of the various costs as factors.

COSTS - Diamond Drilling on "E" Claim June 15 - July 19, 1979

<u>Diamond Drilling</u> = 1434.40 x \$80.78/m	\$ 115,870.83

STATEMENT OF QUALIFICATIONS

Name: Henry Herbert Shear

Profession: Exploration Geologist

Education: B. Sc. -- Geological Engineering (1959);
B. Sc. -- Mining Engineering (1960), both
from University of Arizona

Professional Associations: Member of the Association of Professional
Engineers of British Columbia

Member of The Canadian Institute of Mining
and Metallurgy

Experience: 4 years -- Field Geologist with various companies
in British Columbia

1 year -- Exploration Manager for General
Resources Ltd. in Australia

7 years -- Consulting Geologist and Project
Manager including 4 years with
Quintana Mineral Corp.

1 year -- Project Geologist with Giant Mascot
Mines, Ltd.

May, 1976, to present -- Project Geologist with
Granges Exploration AB

S.V. S.V. Shear
