INTRODUCTION

The claims cover an extension of a west north-west trending mineralized belt that has been traced for over 10 km from Gospel Point on Rennel Sound for the Courte Sb-Au Prospect on Upper Riley Creek. The current programme which consisted of grid soil sampling, geological mapping and rock chip sampling was planned to attempt to locate an anomalous geochem pattern over the claims. Redconnaissance geochem sampling in 1978 provided anomalous Au-As-Hg geochem from base of slope silts.

Surveys on a scale of 1:5000 were done utilizing hipchain, compass, barometer and a topographic enlargement for control. Geochem lines were spaced 150 metres apart with samples collected 50 to 70 metres apart. Soil samples were collected by auger at depths up to 1 m beneath surface and rock chip samples were taken from most of the mineralized outcrops found.

Results of the work programme have indicated a zone 2000 metres long by 150 metres wide of strong alteration and anomalous gold-arsenic geochem. As the current programme used a coarse sampling grid, a detailed sampling programme over the anomalous zone is proposed.

LOCATION AND ACCESS

The property is located on a hill south of the headwaters of Riley Creek and the upper drainage of Phantom Creek northwest of Yakoun Lake, Graham Island, Queen Charlotte Islands.

The property is readily accessible by all weather private logging roads connecting Queen Charlotte City and Rennel Sound. These roads are open to the general public after working hours and on weekends or by special arrangement. The anomalous zone described below crosses the road at an oblique angle and is nowhere more than 400 metres from the road.

TOPOGRAPHY AND VEGETATION

Elevations on the claim group range from 900 ft above sea level along the upper drainage of Phantom Creek to 1900 ft on the hill to the northwest. Valley bottoms and ridge top are covered in mixed cypress-pine swamps and mature hemlock-spruce forest. Hill slopes are heavily timbered with hemlock-spruce-cedar. Overburden is relatively thin, generally less than 5 metres except in the valley bottom where depths of as much as 30 metres are estimated. Outcrop is rare on the ridges and sparse on the valley floor occurring only along some sections of the larger creeks. Nearly continuous exposure of bedrock exists in the numerous creeks draining the hill slopes up to an elevation of about 1400 ft. Above this elevation creeks have not developed and outcrops are few.

MINERAL CLAIMS

The property consists of the eight claims listed below:

GEOLOGY

General:

The geology is very much as described by Sutherland-Brown in B.C. Dept. of Mines Bulletin #54. Rocks of the Yakoun Formation of Jurassic age outcrop on the hill between the headwaters of Riley and Phantom creeks. They are divisible into two mappable units: andesitic flows and pyroclastics; and argillaceous dacitic to rhyolitic tuffs with some argillites, siltstones, sandstones and minor conglomerates. Carbonaceous material is common in the sediments.

South of the headwaters of Phantom Creek rocks of the Longarm Formation of Cretaceous age outcrop down to the road or possibly as far as the east flowing tributary to Phantom Creek. They are calcareous siltstones and sandstones recognized in a few outcrops by the characteristic fossil Inoceramus.

The 2200 foot high hill at the east end of the property is underlain by porphyritic andesite of the Tertiary Masset Formation. Float of similar material is abundant on the hill south of the road above the area underlain by Longarm Formation. The east end of the hill north of the road is underlain by porphyritic andesite that also may be Masset Formation.

Small quartz feldspar porphyry dykes, not mapped, occur in the sedimentary part of the Yakoun Formation in two altered zones - one by the road and the other at the northwest end of the property.

Structure:

Two faults were mapped at the west end of the property that roughly parallel the major Riley Fault System. The Longarm Formation is probably in contact with the Yakoun Formation along a major east-west or west northwest trending fault. The alteration pattern in this area also appears to be affected by such a fault that may be a control of mineralization.

Bedding attitudes are steep, have a general northwest trend but change to a more northerly attitude in the Longarm Formation.

Alteration and Mineralization:

Two clay-carbonate-silica alteration zones with accompanying disseminated and fracture pyrite occur on the property. Both zones contain a few quartz feldspar porphyry dykes. One zone, occurring along the northern boundary of the claims in a tuff-sediment sequence, is 300 metres wide by 800 metres long. The other zone, along the road in the southern part of the claims, occurs in a similar tuffaceous sedimentary package but also occurs in calcareous siltstone of the Longarm Formation. This zone has local tourmalinization (C616) and more pronounced zones of silicification. Carbonate has been destroyed in the silica zones. This second alteration zone is 100 to 200 metres wide and 2000 metres long. The zone may be open to the west but weakens to the east.

GEOCHEMISTRY

The property was staked in 1978 in the belief that the mineralized Riley Fault System extended on to this ground. Subsequently silt samples were collected along the base of slopes on the claim group. They provided Au-As and minor Hg anomalies to indicate the property worthy of a proper evaluation. Subsequent samples were also analyzed for Ag, Zn and Pb. A property evaluation in 1978 by Joe Shearer of McIntyre Mines produced an assay of 0.56 oz/Ton Au somewhere near C571. A piece of float collected near C598 in 1978 ran 1400 ppb Au.

The 1979 programme collected 530 soils and rock chips on lines spaced 150 metres apart with sample sites spaced 50 - 70 metres apart. Rock chip samples were made up from three to ten rock chips, were small enough to fit into standard kraft sample bags and are therefore only preliminary in nature. Silt samples were collected with a spoon from active silt in creeks. Soil samples were collected from the B horizon which occurred from 1 cm to 10 cm beneath the A-horizon except in some areas on the ridges and valley floor. Here samples were made up from mixed A and B horizons and some from just A horizon.

All geochemical analyses were done on the minus 80 mesh fraction by Bondar Clegg & Co., Ltd., 1500 Pemberton Ave., North Vancouver, using the following standard procedures:

Arsenic: Perchloric Nitric - Colometric

Mercury: Controlled Aqua Regia - Closed Cell Atomic Absorption

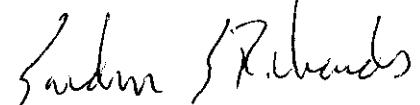

Gold: Fire Assay and Hot Aqua Regia - Atomic Absorption

The two alteration zones described above contain anomalous arsenic-gold geochem. Spot highs for gold and (or) arsenic occur elsewhere on the property. The northern zone is probably of less merit because it is principally an arsenic geochem high whereas the southeastern zone lying along the road contains both gold and arsenic anomalous geochem in rocks and soils. The gold values are similar to and the arsenic values higher than the Courte Au-Sb showing northwest of the property. The occurrence of .04 oz/Ton Au over 300 feet at Courte in a similar style alteration zone makes this zone on the property worthy of a more detailed evaluation particularly since the sample spacing is so coarse. Vertical zoning of gold should be considered when considering drill targets.

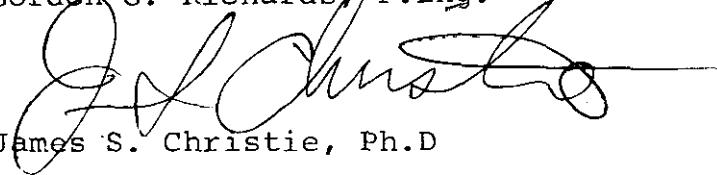

CONCLUSIONS AND RECOMMENDATIONS

A programme of soil and rock chip sampling on a 1000 m by 400 m grid with lines spaced 50 cm apart and sample intervals at 25 m is proposed. The grid area covers the western half of the Au-As geochem anomaly discovered earlier in the year. The eastern 1000 m of the anomaly is covered in swamp and since preliminary soils did not respond over this zone it is proposed to map and sample outcrops in the few creeks cutting the swamp and await results of this programme before planning further exploration in this area.

Respectfully submitted,

Gordon G. Richards, P.Eng.

James S. Christie, Ph.D

ITEMIZED STATEMENT OF COSTS

August 20 - November 1, 1978:

Sampling

W.A. Howell - 2 days @ \$150/day	300.00
Food - 2 days @ \$20/day	40.00
Truck Rental	50.00
Airfare - Vancouver-Sandspit-return	150.00
