Introduction

A percussion drilling program was carried out on the IRK VII and IRK VIII claims from November 5th - 15th and November 17th - 18th, 1979 by Asarco Exploration Company of Canada, Limited. The purpose of the drilling program was to investigate Zn, Pb, Ag and Cu soil anomalies located within the IRK VII and IRK VIII claims.

The percussion drilling was contracted to Lorne Spence Enterprises of Smithers, B.C. A Nodwell mounted Atlas Copco drill was used to drill holes approximately 5 cm in diameter, M. F. Lancaster of Asarco supervised the program and was assisted by Dale Wallster.

Location and Access

The Parrott Lakes Prospect is located approximately 23 km. south of Houston, B.C. near to 54° 12' N and 126° 38' E, in 93 L/2E, Omineca Mining Division.

Irk VIII	10	1776) --	PAR I GROUP
Irk IX	2	1777)	
Irk X	6	1786)	

Work Done

Seven percussion drill holes totaling 459 meters were drilled on the Irk VII & VIII claims during the period November 8th - 16th, 1979 inclusive. A total of 26 man days were spent supervising the drilling operation and collecting 144 samples of percussion drill cuttings at 3 meter intervals. These samples were analysed for Cu, Pb, Zn and Ag. Construction of 1,000 meters of roadway, 3.5 meters wide provided access to the drill sites.

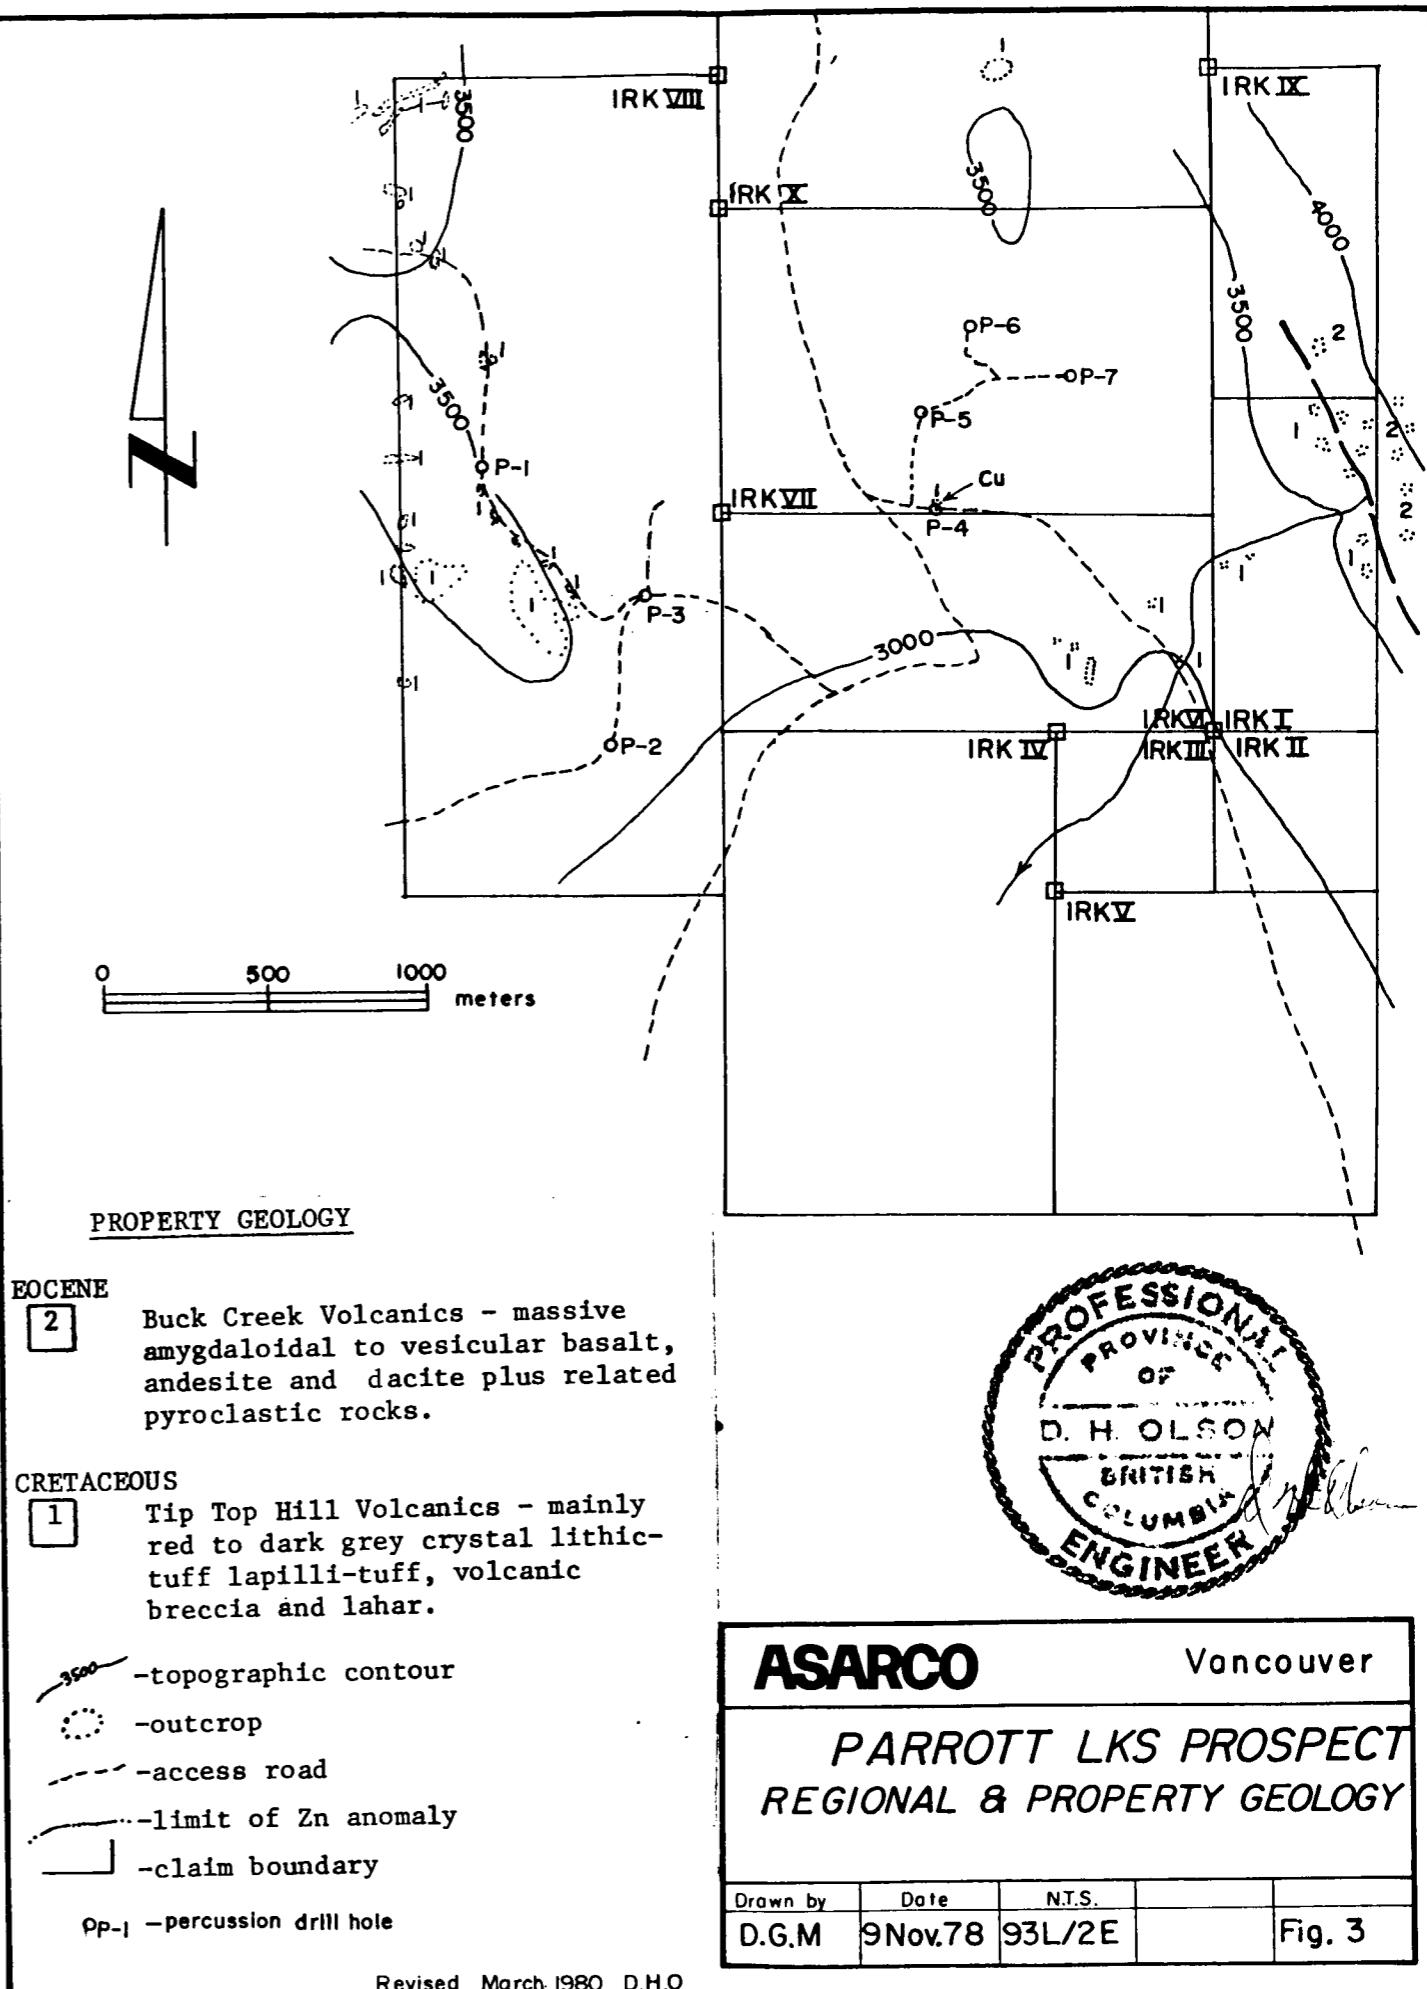

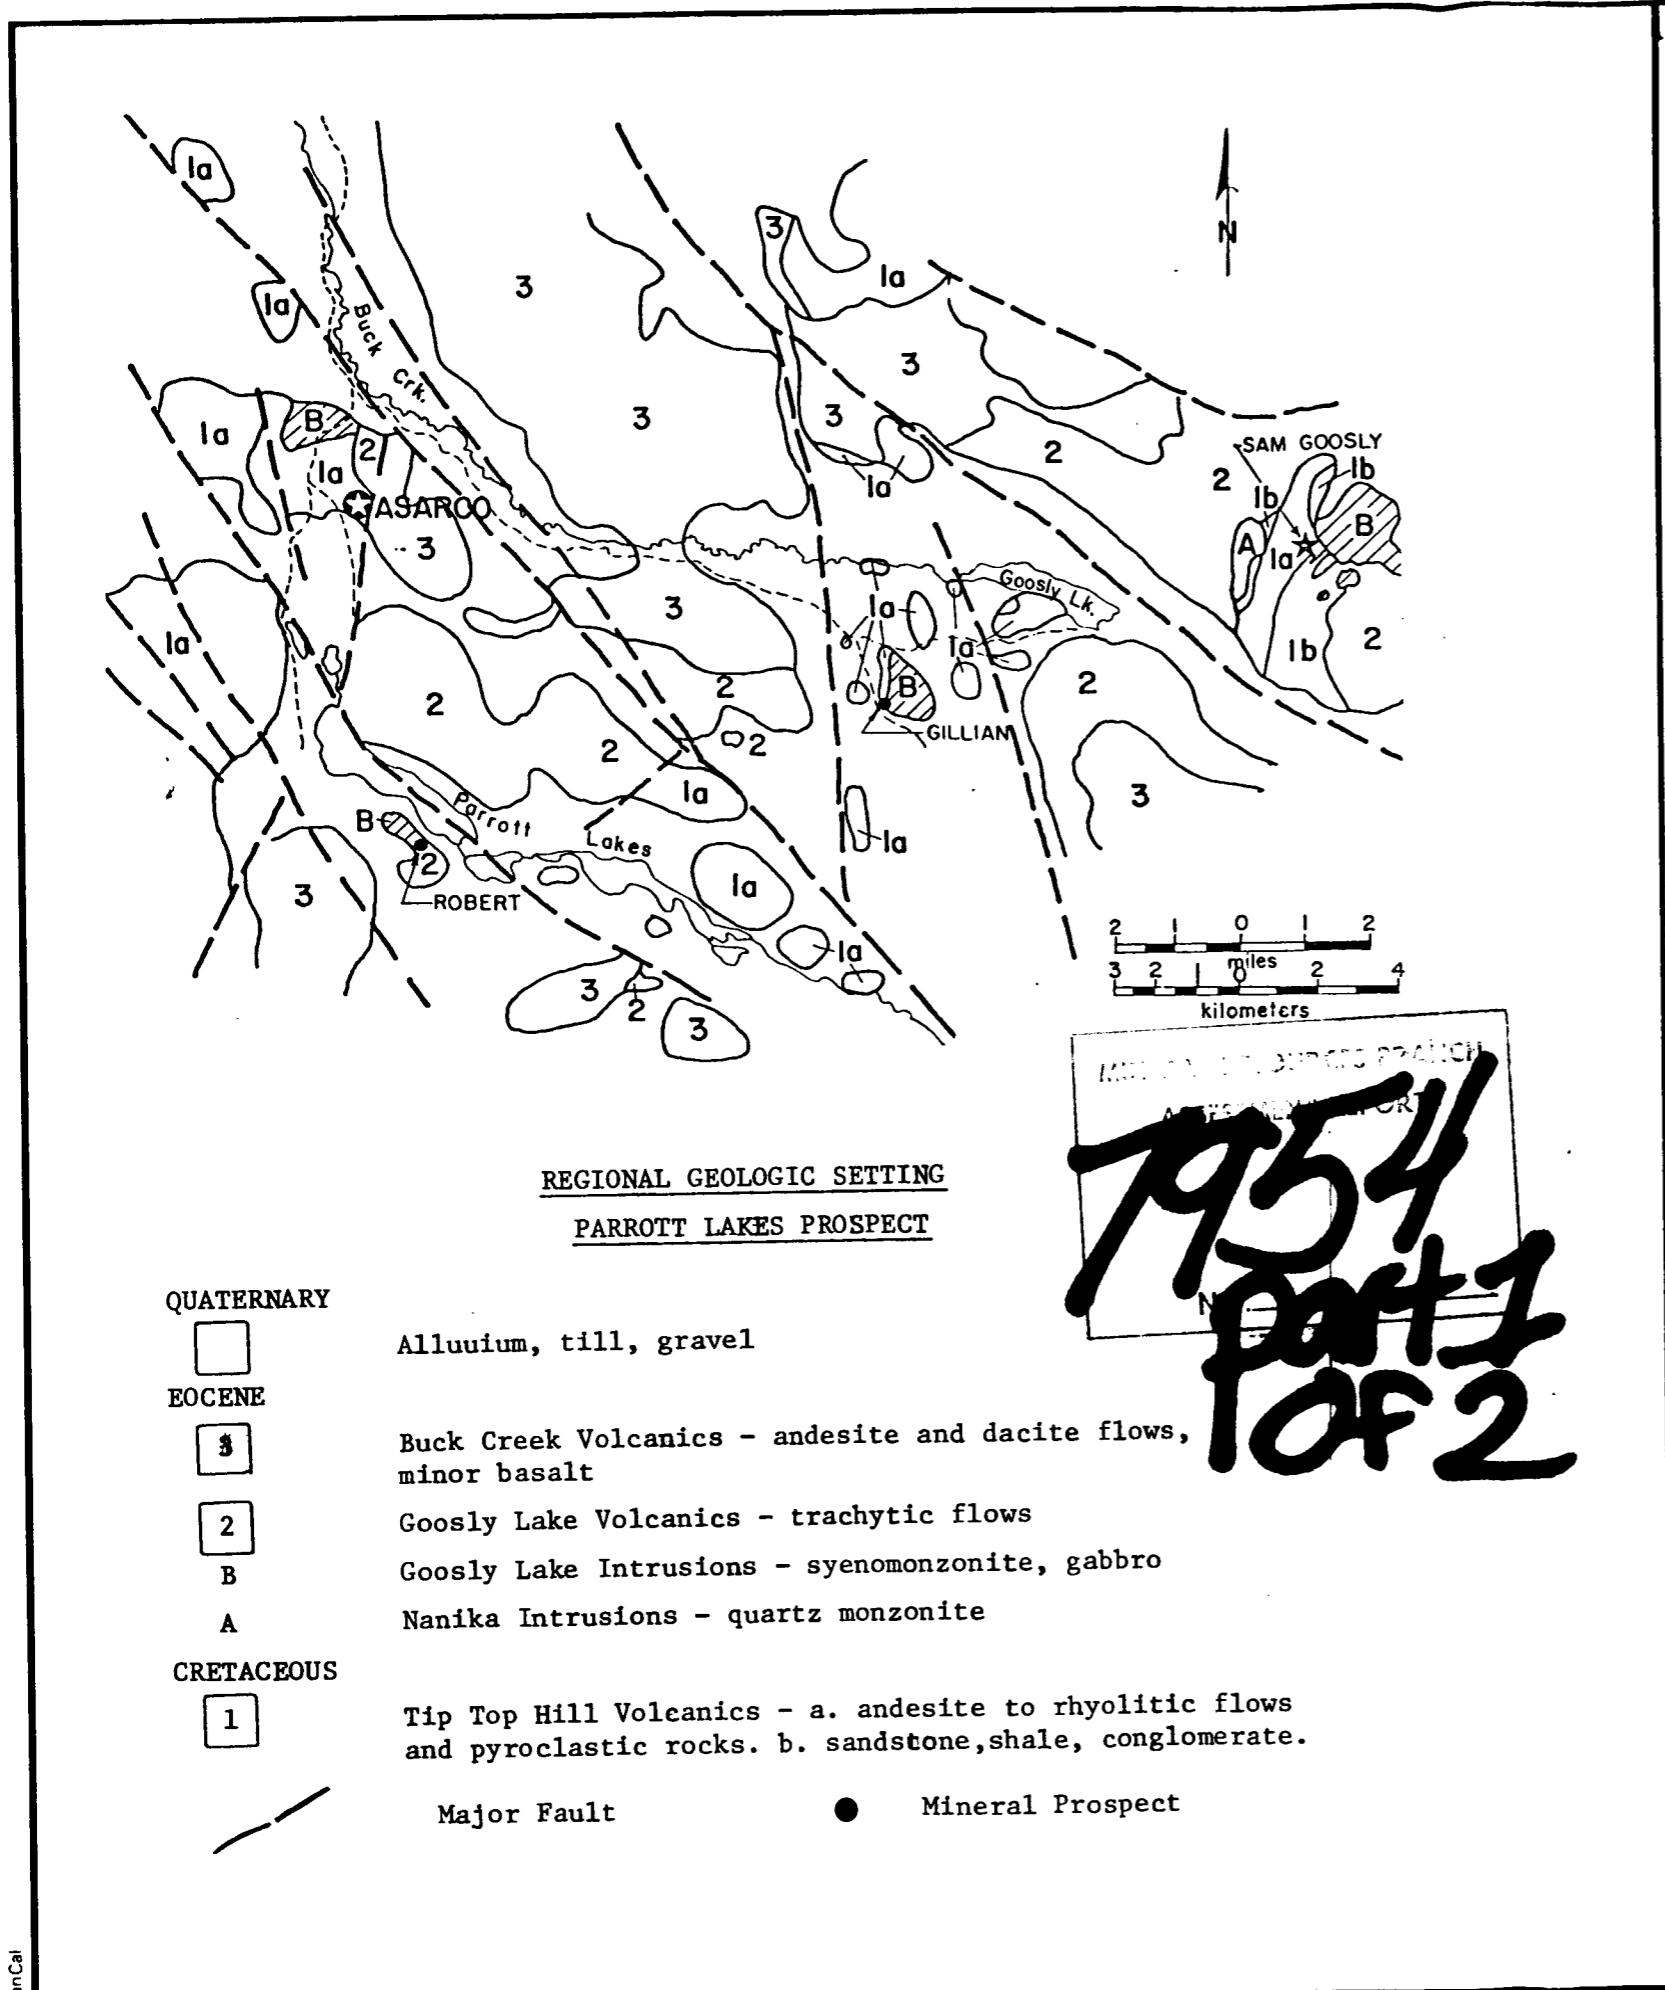

Cost of the drilling program is itemized in Appendix "A". Assay data is listed in Appendix "B".

Geology (Figure 3 - revised)

A comprehensive regional geologic setting is given in an earlier report dated November 30, 1978 and written by D. G. MacIntyre on the Irk VI claim.

Andesitic to rhyolitic flow and pyroclastic volcanic rocks believed to be part of the Tip Top Formation of the Cretaceous age are exposed in rock outcrops sparsely distributed over the Irk VII, VIII & IX claims. Weakly pyritized andesitic volcanic rocks occur in the south central portion of the Irk X claim.

Most of the claims area is covered with a mantle of glacial till. The latest ice movement is believed to have been from west to east.

Percussion Drilling Results

Seven percussion drill holes totaling 459 meters were drilled to investigate Zn, Pb, Ag and Cu soil anomalies established earlier in 1979.

See Figure 3 for hole locations. Appendix "B" for assay data and Appendix "C" for logs of percussion holes.

Significant anomalous values for Pb, Zn and locally Ag were obtained from percussion drill holes P-5 and P-6 only. Within hole P-5 from bedrock surface at 6 meters to the bottom of the hole at 60.9 meters, the anomalous values range from 380 - 2700 ppm for Zn, 142 - 800 ppm for Pb and up to 1.0 ppm for Ag. In hole P-6 anomalous values for Zn range from 410 to 1000 ppm from 18.3 to 60.9 meters, while anomalous values for Pb occur from 48.8 to 60.9 meters and range from 114 to 122 ppm. Values for Ag in hole P-6 are not anomalous. Erratic anomalous Ag values up to 2.2 ppm occur in holes P-2, P-3 and P-7.

Pyrite was the only sulfide mineral noted while magnetite occurred much less frequently in samples from the percussion drill holes. Hematite was noted in several rock outcrops and is evident in holes which produced a red coloured water return during the drilling process.

Rocks penetrated by the percussion drill varied from gray to red-brown crystal tuffs, lapilli tuffs, volcanic breccia and lahars of the Cretaceous Tip Top Hill Formation.

Conclusions

Anomalous Zn-Pb-Ag values obtained from percussion holes P-5 and P-6 indicate the presence of Zn-Pb-Ag mineralization in the rocks in the vicinity of these holes and to some degree has confirmed anomalous Zn-Pb values in the soils. Additional exploration is warranted. Future exploratory work should encompass more detailed soil sampling followed by drilling peripheral to holes P-5 and P-6.

D. H. Olson
