ALTAIR drafting services ltd.

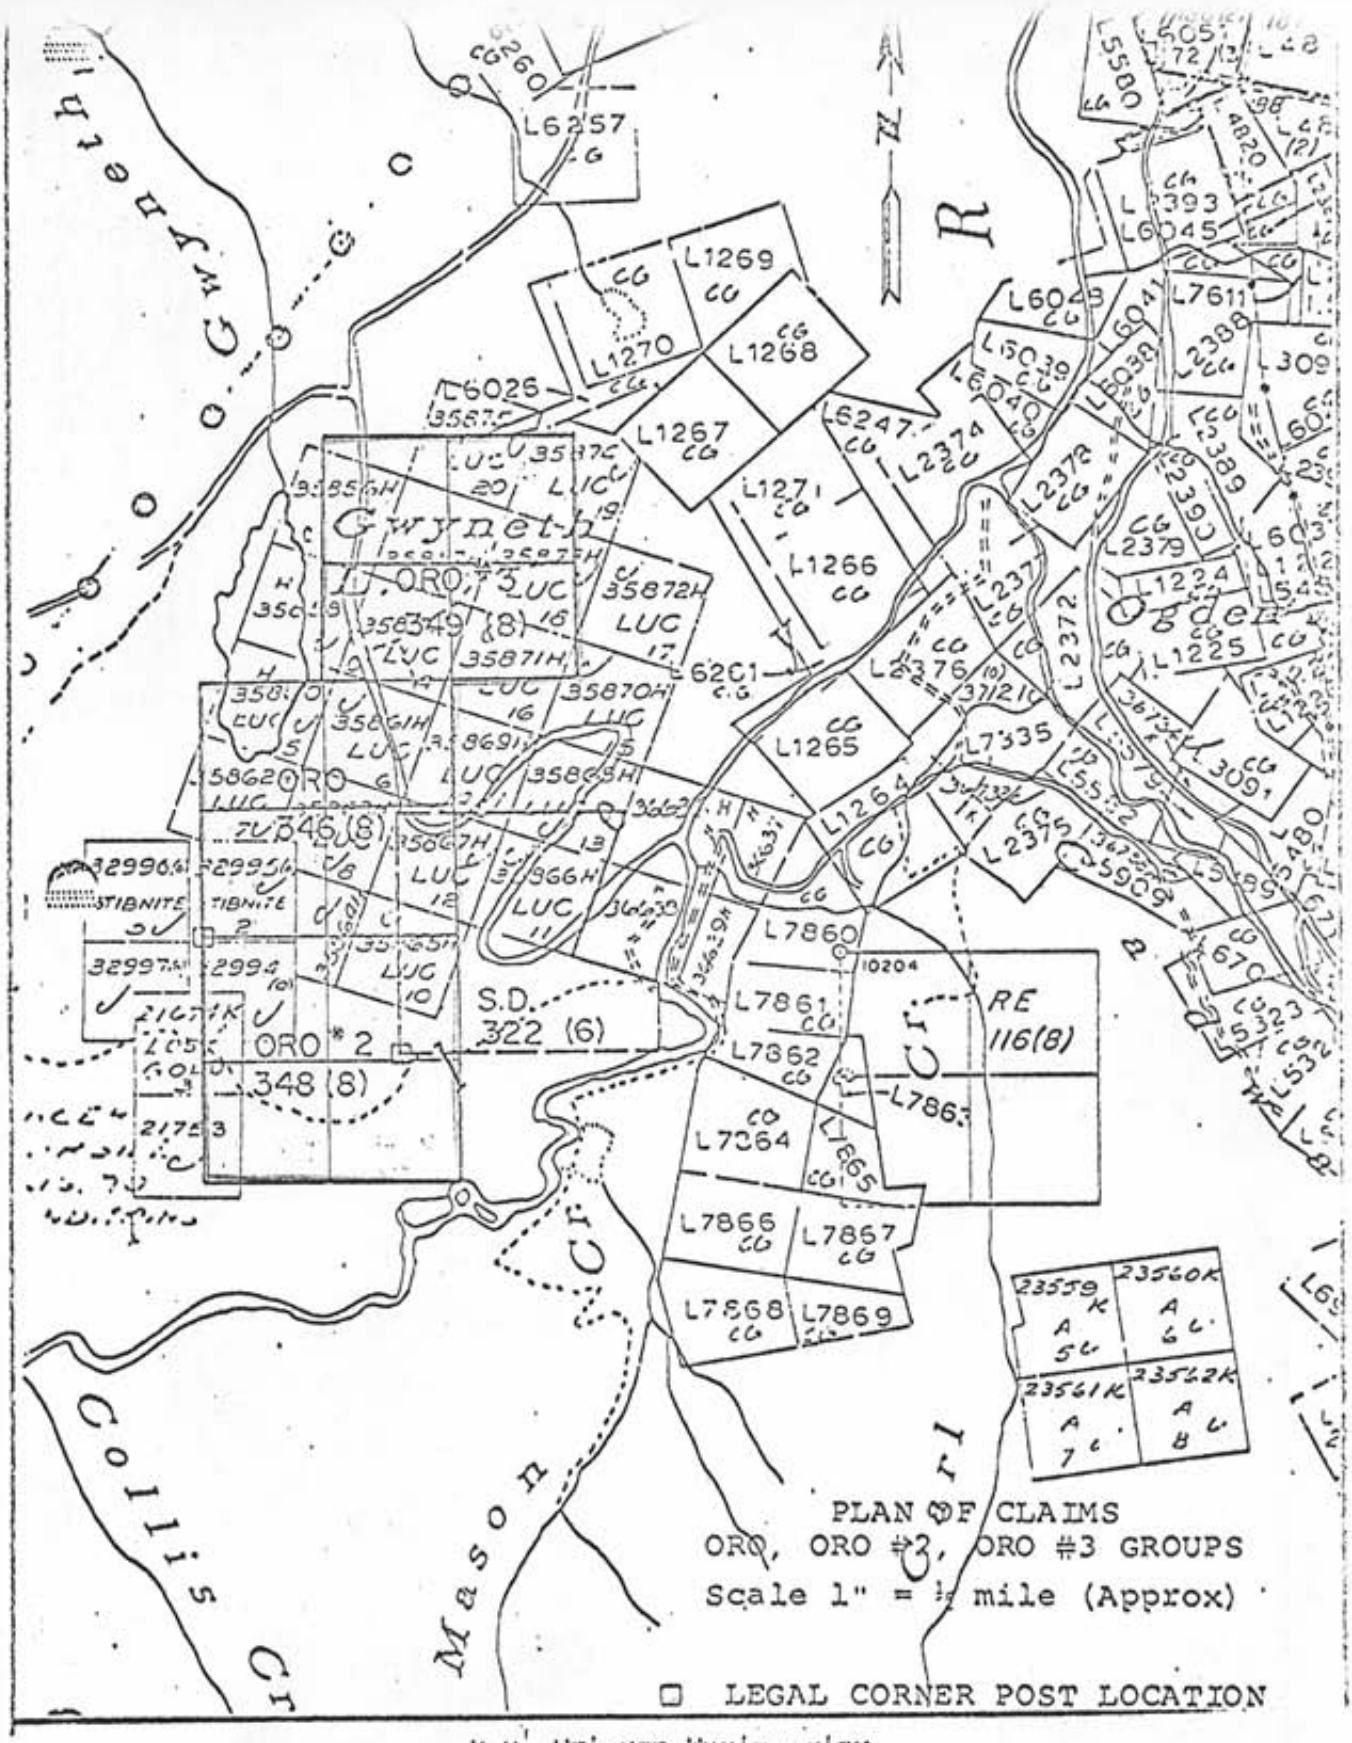
INTRODUCTION

The property comprises 12 located claim units in the Lillooet Mining Division and its situated east and south of Gwyneth Lake and approximately 20 kilometers south of Goldbridge, B.C.

The Hurley River Road from Bralorne to Pemberton crosses the property and secondary roads traverse the claims.

No past history of the property is available, but near the south boundary of the claims several old pits have been sunk on a narrow stibnite rich vein.

Line cutting and soil sampling carried out in 1979 gave encouraging results and further soil sampling and trenching is planned for the 1980 season.



P.H. Ericson Engineering

Claim Map of
Oro Group

NEW CONGRESS RESOURCES LTD. (N.P.L.)

ASSESSMENT REPORT

Between Sept. 1st, 1979 and Sept. 18th 1979, an 800 metre north south baseline was established on the Oro No. 2 claim with stations at 80 metre intervals.

East - west crosslines were run 200 metres east and west from the stations with soil samples being taken at 10 metre intervals in the southern section of the Grid (6 lines), and at 20 metre intervals on the northern section of the Grid (5 lines).

A total of 339 samples were taken and assayed for gold by General Testing Laboratories, 1001 East Georgia St., Vancouver, B.C.

The program was supervised by H. E. Derraugh on the recommendations of H. Brodie Hicks, P. Eng., with the interpretation and plotting being carried out by P. S. Friesen, B.Sc. P. Eng., 6780 Sumas Prairie Rd., R.R. #1, Sardis, B.C. whose report is attached.

The assessment report is accompanied by the following:

1. Index Map showing location of property
2. Introduction
3. Claim Map
4. Assessment Report and Index
5. An itemized cost statement of the Grid layout and sampling
6. Assay certificates from General Testing Laboratories Ltd.
7. Statement qualifications of writer
8. Invoices covering assaying of soil samples
9. Report and interpretation of the results of the Geo Chemical survey by P.S. Friesen, B.Sc. P.Eng.

COST STATEMENT

LINECUTTING		1250:00
SOIL SAMPLING		1500:00
ASSAYING		1525:00
	TOTAL	$ 4275.00

CERTIFICATION

I, Harold E. Derraugh, residing at 1202 - 2060 Comox St., in the city of Vancouver, in the province of British Columbia, hereby certify as follows:

That I have been employed in the exploration, development and production areas of the mining industry over the past 40 years in varying capacities in Canada, U.S.A., Mexico and South America.

That the information contained herein was compiled as a result of my supervision of the work done on the Oro claims between September 1st, 1979 and September 18, 1979.

H. E. Derraugh

Report on the Soil Geochemical Survey for Gold

ORO GROUP

Bridge River Area, B.C.

by

P. S. Friesen B.Sc. P. Eng.

22 July, 1980

SUMMARY

In 1979, a grid was established over part of the ORO group of claims. Samples were collected at 10 meter intervals along 400 meter long lines spaced 80 meters apart and bearing due east- west. These samples were submitted for parts per million of gold analysis.

In the southern part of the grid, anomalous values of gold in parts per million were obtained from some of the samples. A brief visit was made to check this area and to confirm the existence of the two of the claim posts. In the southeastern part of the grid, three trenches were found in a narrow vein containing 40 to 80 per cent stibnite. The vein strikes north 80 degrees west and dips 50 to 70 degrees north. Near the highest anomaly, 200 meters northeast of the trenches, fragments with 50 per cent stibnite were found but trenching for the sources has not yet been attempted.

It is encouraging to note that soil geochemical surveys for gold is a very useful method in locating veins in this area. The survey should be extended to cover the entire property.

INTRODUCTION

The 3 ORO claims were acquired in 1978. Preliminary investigation consisted of establishing a grid 400 meters by 800 meters. Soil samples

Claim Map of
Oro Group

NEW CONGRESS RESOURCES LTD. (N.P.L.)

were taken to 10 meter intervals along east-west lines spaced 80 meters apart. The samples were analysed geochemically for gold; the results are given in parts per million.

THE PROPERTY

The ORO group consists of 3 groups of four claims. Each claim is 1500 feet square. The claims are contiguous, their location is shown on Map 2.

LOCATION

The ORO claims are situated 21 kilometers south of Goldbridge, B.C. in National Topographic subdivision 92 - J - 15 - W. The centre of the claims is approximately at the intersection of longitude 122 degrees 52 minutes 30 seconds and latitude 50 degrees 47 minutes. The property is in the southwestern part of British Columbia. The south part of Gwyneth Lake lies in the northwest corner of ORO No. 1.

MEANS OF ACCESS AND FACILITIES

The Pemberton to Braelorne road, locally known as the Hurley Pass road crosses the southern part of the ORO claims. The road is passable during the summer months using a two wheel drive vehicle.

Another road from Goldbridge to Gwyneth Lake bears southerly immediately east of the northwest corner of ORO No. 3, about 100 meters east of Gwyneth Lake. This road connects with the Pemberton - Braelorne road. The claimed area has been logged and bulldozer roads crisscross much of the property.

The Westcoast Gas pipeline passes about 1000 meters west of the north west corner of the property.

Hydroelectric power extends to Braelorne some 20 kilometers from the property.

HISTORY

The area has been prospected in the past but no data was found concerning early work. Three pits were dug along a vein 4 to 8 inches wide, striking north 80 degrees west and dipping 50 to 70 degrees north.

The area was previously claimed by mineral dispositions known as the LUC claims. No further data was found.

Regional geological and aeromagnetic surveys have been carried out by the Federal and/or Provincial governments.

GEOLOGY

The geology has not been mapped in detail. Outcrops of andesite were noted in the area where the trenches are located. In the southwestern part of the property, large exposures of finely-layered, cherty sediments are present.

The narrow vein exposed in three trenches is composed of 30 to 80 per cent stibnite. The stibnite at times is confined to narrow seams parallel to the wals of the dyke and at other times forms large radiating acicular crystals. The stibite is in a calcareous gangue with a carbonate seam free of stibnite lining both margins of the vein. Alteration of the wallrock is slight over a few centimeters.

SURVEY PERIOD

The soil samples were collected in September 1979.

SURVEY CONTROL

An 800 meter north-south baseline was established north from a point 94.5 meters west of the south centre claim post of ORO No. 2. Crosslines started along the south boundary of the property, extending 200 meters east and 200 meters west of the baseline. An additional ten parallel lines with the same relationship to the baseline were established every 80 meters northward.

Samples were taken at 10 meter intervals along six southern lines and at 20 meter intervals along the five northern lines.

Samples were taken by digging below the surface layer of ash and leached overburden.

NUMBER OF SAMPLES

Of 351 stations established, 339 soil samples were taken. Three stations were underlain by bedrock (BR on Map) and seven by swamps (marked SW on Map) and one was in a rock slide (RS on Map).

ANALYSES

The soil samples were submitted to

General Testing Laboratories
1001 East Pender St.
Vancouver, B.C. V6A 1W2

The samples were tested geochemically for gold only and the results are given as parts per million gold. The samples were tested in two batches at different times.

METHOD OF ANALYSIS

A brief description of the method used in analysing the soil samples for gold has been provided by the laboratory and is appended . (Appendix No. 1)

SURVEY RESULTS

The actual values of gold in parts per million as determined by the laboratory are appended (Appendix No. 2)

A histogram plotted of the results indicates that a value of 0.08 parts per million and over is anomalous. Soil from 25 stations had anomalous concentrations of gold. All of these occur along the four southern most lines.

Prior to sampling program, an unknown source stated that two long trenches bearing north-south had been made. On the basis of this information, the control lines had been established in an east-west direction. Examination of some of the anomalous areas resulted in the rediscovery of a vein 10 to 20 centimeters wide, striking north 80 degrees west and dipping 50 to 70 degrees north. In retrospect, it would have been better to sample stations along lines bearing north-south. Contouring of the anomalous values, as a result, gives a distorted configuration.

In spite of the unfortunate direction of the control lines, it is most encouraging to note that the geochemical analysis of soils for gold can be applied to this area as a rapid, inexpensive exploration tool.

Further support of this is the occurrence of fragments, rich in stibnite, near station 5E on line 240 N where the highest geochemical values for gold were obtained for the entire surveyed area.

CONCLUSION

The geochemical analysis for gold of soil samples has proven to be a rapid inexpensive method of exploring the ORO claims. Further sampling of the rest of the property as well as trenching in the known anomalous areas is warranted.

RECOMMENDATIONS

It has been proven that geochemical analysis for gold of soil samples on the ORO claims can be used with confidence. It is recommended that the entire property should be checked using this method. The control grid established should be used to map the geology of the claims.

A bulldozer should be employed to strip the areas where anomalous concentrations of gold were found in the soils. This should be proceeded by prospecting and followed by hand trenching if necessary. Detailed sampling and assaying of any mineralized vein discovered should follow. The work program should be done in stages.

ESTIMATION OF COSTS

PHASE I

(A) Present Grid Area

1.	Map the Geology	1500.00
2.	Trench in anomalous areas	2000.00
3.	Sample the baseline at 10 meter invervals. 80 x 15	1200.00
4.	Sample 4 lines parallel to the baseline spaced 100 meters apart at 10 meter intervals from line 0 to 320 N. 4 x 320 = 1280' = 128 samples	1920.00
5.	One line from 800 N to the north end of the property.	

4000 - 800 =	3200 m at 10 m intervals = 320 samples	4,800.00
		11,420.00
Contingencies		1,280.00
Say		12,700.00
Overhead		1,300.00
	Total $	14,000.00

PHASE 11

13 lines at 100 meter spacing treading north and south should be sampled at 10 meter intervals over the entire property. The baseline and its extensions should have been sampled in Phase 1, leaving 12 lines. The lines would be approximately 3.2 kilometers long (3200 meters). The total number of samples would be

12 x 3200 10 = 384 samples

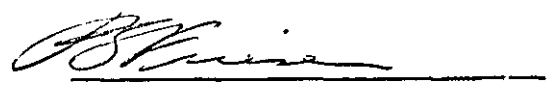
(1)	The establishing of the grid	$	1,000.00
(2)	Collection of samples		38,400.00
(3)	Analysis of samples		15,280.00
(4)	Geological mapping & supervision		5,000.00
(5)	Final Evaluation Report		2,500.00
			62,180.00
	Contingencies		6,218.00
			68,398.00
	Office Overhead		6,839.80
			75,237.80
	Say		76,000.00
	Total	$	88,500.00

PHASE 111

Contingent on the previous results, it would be logical to trench and possibly diamond drill anomolous areas discovered.

Respectfully submitted

P.S. Friesen Engineering



P.S. Friesen B.Sc. P. Eng.

I, Peter S. Friesen of Sardis B.C. hereby certify as follows:

I am a geological engineer residing at 6780 Sumas Prairie Rd.,
R.R. #1 Sardis, B.C.

I am a registered Professional Engineer in British Columbia

I graduated from the University of Saskatchewan in 1950

I have practiced my profession except for one year spent in teaching since 1950

I have no interest directly or indirectly in the properties or Capital stock of New Congress Resources Ltd. (N.P.L.) nor do I expect to receive any.

The above information is based upon available data in the company files and personal examination of the property in June 1980.

That this report may be used in a Statement of Material Facts or similar document but may not be abbreviated or excerpted without my consent.

P.S. Friesen B.Sc. P. Eng.

August 12, 1980

To Mr. Peter Friesen,

Re - method of analysis for geochemical gold determinations: 10-15 gm sample, concentration by fire assay, gold-silver dore dissolved in aqua-regia, atomic absorption finish.
