Introduction

A program of geological and geochemical exploration was conducted on the Argen property of the 1980 Rock Creek Joint Venture, during the summer of 1980. Six persons were employed running grid lines, collecting soil samples, mapping the geology of the claims, and sampling the present workings. These efforts involved a total of 27 man-days. Crews operated from a field camp eight miles northwest of Westbridge. The program was financed by the 1980 Rock Creek Joint Venture, under the supervision of Allen Resource Consultants Ltd.

Description of the Property

The Argen property consists of one reverted crown-granted mineral claim, the Argen (L343) Record No. 2116; and six located claims RCJV Nos. 1-6 inclusive, Record Nos. 2273-2278 inclusive. The claims are owned 100% by the 1980 Rock Creek Joint Venture, and are held in trust for the joint venture group by one of the group, the registered owner, Dayton Creek Silver Mines Ltd. The Argen claim has a present expiry date of April 8, 1980, whereas RCJV Nos. 1-6 inclusive expire on June 13, 1980. The claims are located in the Greenwood Mining Division, one mile northeast of Camp McKinney. More specifically, the location can be described as Latitude 49°7'N, and Longitude 119°10'W.

Access

The Camp McKinney-Mount Baldy road leaves the southern Trans-Canada Highway about nine miles west of Rock Creek, and passes about a mile to the southwest of the claims at Camp McKinney. There are a number of secondary roads in the area, one of which touches into the eastern portion of the claims. The access used during this years work was a recently bulldozed road along the right-of-way for the hydro line, which cuts through the western portion of the claims.

Topography

The claims area is marked by moderate to gentle northeast-facing slopes to Rock Creek. There is moderate forest cover with occasional areas of open grassland. The lower elevations are marked by swamps and muskeg. Trending southeast through the central portion of the claims are a number of glacial gravel ridges. Rock outcrop makes up only about 10% to 15% of the claims area.

History

There is no recorded history of work in this particular area. Past efforts are, however, evidenced by the old trenches and the Argen shaft.

Description of Workings

The Argen Shaft is located 300 feet @ 305° , then 215 feet @ 250° from the Initial Post of RCJV Nos. 3 and 4. The shaft measures 18 feet by 14 feet, and is estimated to be about 20 feet deep, with 10 feet of water. From the shaft, 30 feet @ 295° is a small caved pit, with a small dump. From the pit 150feet @ 300° is a ridge outcrop, from which scattered pockets of rock have been extracted.. From the ridge 75 feet @ 130° is a trench six feet long, two feet wide, and about a foot deep, that has slumped in.

Another set of workings is located immediately northwest of Station 10NW, 4SW. The trench nearest to the station is 20 feet long at a 70° strike. The trench is four feet wide, three feet deep and caved. A second trench lies 50 feet @ 10° from the first. It is 15 feet long at a 40° strike with a pit at the north end. The trench is three feet deep and four feet wide, and the pit measures seven feet by seven feet by seven feet. Pit and trench are both caved, but some rusty rock lies on the dump.

The only other set of workings observed lie partly within the

boundaries of the Wonder Y (Last Chance) claim, between Lines 3NW and 4NW, near Stations 4SW and 5SW. There are a considerable number of old trenches and pits in this area, but as the majority appeared to be off the Argen property, they were not mapped in detail.

Geology

The general Camp McKinney area is underlain primarily by meta-volcanics and meta-sediments of the Permian/Triassic Anarchist group, intruded by the acid to intermediate Nelson igneous assemblage. Locally, gneisses and schists of the older Paleozoic Monashee group occur in the western portions of the area. Some parts of the area are capped by Tertiary volcanic flows.

No igneous rocks were observed on the Argen property. All mapped lithologies are of a meta-sedimentary nature, grading from siliceous schist to quartzite. This assemblage belongs to the Anarchist group. Structurally, the rocks trend to strike north-south, with steep dips.

Figure No. 8 shows the geology of the claims area that was mapped. Reference to the numbering system used is described as follows.

#1 Quartzite - close to source, trace of sand grains evident, speckled, salt and pepper, reddish in part, weathers dark grey, occasional fragment of vein quartz that is irregular and vuggy, white, milky with slight manganese stain, pyrite casts.

#2 Quartzite - as above in outcrop. Strike east, dip 75°S. Rubble over a considerable area. An occasional piece of very fine-grained lithographic limestone, that is light buff to grey

#3 Quartzite - as above in outcrop - dark grey to black on fresh surface
#4 Trench - runs 10 meters east-west, and 10 meters southwest. It is three feet deep and three feet wide. There is considerable quartz on the dump with visible galena. Country rock is dark grey, fine-grained, partly rusty quartzite. A sample of mineralized quartz from the dump (#23202) assayed; gold - 0.056 oz/ton; silver - 12.0 oz/ton, and lead - 8.7%.

#5 Quartzite - limy, fine-grained, variegated, light to medium grey.

#6 Quartzite - very fine-grained, white to light grey, trace sand grains, weathers medium to dark grey, hard, dense, angular. Trace minor vein quartz in rubble. Scattered outcrop within local area.

#7 Quartzite - as above, limy

#8 Quartzite - dark grey to black, very fine-grained

#9 Meta-sediment - slightly metamorphosed sandstone, salt and pepper, hard, dense, angular, partly rusty, grades to quartzite. Some white quartz in rubble, partly vuggy.

- #10 Quartzite - mottled, same as #5, with siliceous, chloritic schist, distorted, partly rusty, quartz rubble. Strike NW, dip 75°SW
 #11 Metasediment - banded quartzite to siliceous schist, salt and pepper, some rust, weathers dark grey.
 #12 same as #8
 #13 same as #11. Strike 148°. white quartz plug
 #14 Quartzite - extensive ridge varies from #11 to #8 types. Some minor quartz rubble
 #15 Quartzite - near trench, caved. rock similar to #8, only medium grey, rusty. Quartz is very vuggy with no visible sulphides
 #16 same as #10
 #17 Quartzite - dark grey to brown, hard, dense, partly rusty
 #18 Quartzite - salt and pepper, distorted, almost sandstone. Minor quartz veinlets, medium grey to buff, also dark grey to black, very fine-grained quartzite with pyrite, rusty.
 #19 Quartzite - extensive ridge with various varieties of quartzites, mainly mottled, grading to siliceous schist, also dark grey to black, partly rusty variety. Some quartz veinlets. Strike 340°, dip 80°NE.
 #21 Quartzite - very argillaceous, dirty, mottled brown and grey, trace quartz. Country rock around trenches is siliceous schist interbedded with dark grey quartzite. Country rock is rusty. Minor quartz is rusty and vuggy near south trench. Remnants of thin vein. Vein material from south trench sampled and assayed (#23223) gold - 0.017 oz/ton, silver - 1.00 oz/ton, and lead - 1.30%. Country rock around north trench much the same. Vein was not observed in place, but pieces on dump highly leached. Dump quartz assayed (#23222) gold - 0.011 oz/ton, silver - 0.19 oz/ton, and lead 0.18%.
- #22 Siliceous schist

Country rock at the Argen Shaft is a very siliceous meta-sediment, grading to quartzite. The strike and dip cannot be determined. The rock is highly fractured, banded, and jointed. The light blue-grey fresh surface contrasts with dark grey weathered exposures. The rock is cut by a quartz-infilled shear striking at 305°, and dipping 80°SW. The shear zone varies from 6 inches to two feet wide in the shaft and is very rusty. The quartz is mineralized with pyrite and galena. A sample taken of the dump material (#19837) assayed gold - 0.052 oz/ton, silver - 0.41 oz/ton. The vein, as exposed in the southeast side of the shaft was blasted with $\frac{1}{2}$ stick of Tovex to expose fresher material. A sample taken across 14 inches of the newly exposed vein (#23188) assayed gold - 0.07 oz/ton, silver - 1.4 oz/ton, and lead - 1%. A six-inch hole was then drilled into the vein and it was blasted a second time with $1\frac{1}{2}$ sticks Tovex. Vein exposed was 8 inches wide and was sampled (#23189) assaying gold - 0.016 oz/ton, silver - 0.56 oz/ton,

and lead - 0.69%.

In the vicinity of the Argen Shaft, two other samples were also taken for assay. Rusty material from the ridge 180 feet to the northwest (#19836) assayed gold - less than 0.003 oz/ton, silver - less than 0.01 oz/ton. The trench, 75 feet southeast of the ridge yielded gold - less than 0.003 oz/ton, silver - 0.03 oz/ton from a dump sample (#19835).

Geochemistry

A 100 meter by 50 meter grid was laid out by chain and compass over approximately 70% of the property. Lines and stations were flagged with ribbon. Soil samples were collected at the stations from the B soil horizon, which in this area is located at depths ranging from 2 inches to 10 inches below the surface. Sample material was stored in pre-numbered, waterproof, kraft-paper envelopes, which were allowed to dry, and then sent to Chemex Labs Ltd. in Calgary for analyses. For analyses, the samples were sieved to the -80 fraction, subjected to perchloric acid digestion, and analyzed for copper, lead, zinc, silver, and arsenic by atomic adsorption. Gold analyses were run by fire assay.

The analytical results were plotted on a frequency histogram for each metal (see Plates Nos. 3 to 8 inclusive. From visual examination of the histograms, three concentration levels (with the exception of silver), which were considered high background to anomalous were defined. These levels were used as contour levels on the geochemical maps (see Figures Nos 1 to 6 inclusive). Figure No. 7 is a composite of the more anomalous areas for each metal superimposed.

Examination of Figure No. 7 shows anomalous geochemical areas at a number of locations. The more significant of these, which warrant further work are: a two hundred meter zone trending north-northwest from Station 3NW, 4SW; an area extending from the Argen Shaft and east

to the baseline, and in the general area of Stations 6NW,0, and 6+ 24NW,0; the general area surrounding the trenches near 10NW,4SW; and the source of a very high lead value (486ppm) at Station 11NW,1SW.

Conclusions

1. Approximately 70% of the Argen claims area was gridded, geologically mapped, and geochemical soil samples collected, analyzed, and evaluated. A number of old, unreported workings were located, examined, and sampled for assay.

2. Geological mapping showed the interest area to be underlain by a series of siliceous meta-sediments of the Anarchist group.

3. Mineralization, where observed, was in the form of pyrite, and galena in vein quartz. The veins occurred in shears, or along bedding planes in the country rocks.

4. Assays of mineralized material were generally low in silver and gold. The most notable exception was from the dump sample taken at the Wonder Y (Last Chance) workings where 12.0 oz/ton silver and 8.7% lead was returned.

5. The geochemical survey defined four areas of interest that warrant further work.

Recommendations

1. Attempt to acquire rights to the Wonder Y (Last Chance) claim, either through lease or purchase.

2. Lay out 20 meter by 10 meter grids: over the area of the workings on the Wonder Y (Last Chance) and adjacent Argen land, as well as the strong trend of coincident geochemical anomalies that runs from 3NW,4SW to 5NW,2SW; the general area around the trenches near 10NW,4SW; over the lead anomaly trend that runs from 11NW,1SW to 11+65NW,2SW; and over the general area from 6NW,1NE to the Argen Shaft. Detailed prospecting, geological mapping, and geochemical soil sampling should

then be carried out over these detailed grids. The workings around the Wonder Y (Last Chance) and the Argen claims, that show evidence of mineralized rock should be cleaned up, and fresh rock exposed by blasting. The same approach should be taken with the trenches near 10NW, 4SW.

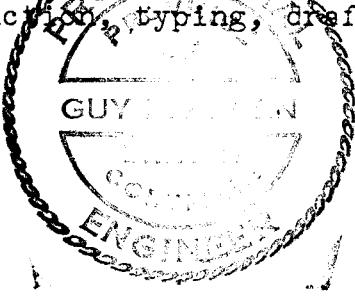

Any areas giving positive results on the basis of this work could be further evaluated by detailed geophysics and short-hole drilling in a subsequent phase of exploration.

Cost Estimates - Phase II - 1981

| | |
|--|------------|
| 1. Preparation of detailed grids; 12 man/days @ \$65 | \$780.00 |
