## INTRODUCTION

This report was prepared pursuant to a request by Ware Resources Ltd., Suite 311, 543 Granville Street, Vancouver, British Columbia.

The purpose of this report is to review the results of a geochemical survey over the claim area as well as the available information on the ARM-IDA mineral claim group and assess the mine-making potential of the property. The writer did a cursory examination of the claimed ground in the field on July 28, 1980.

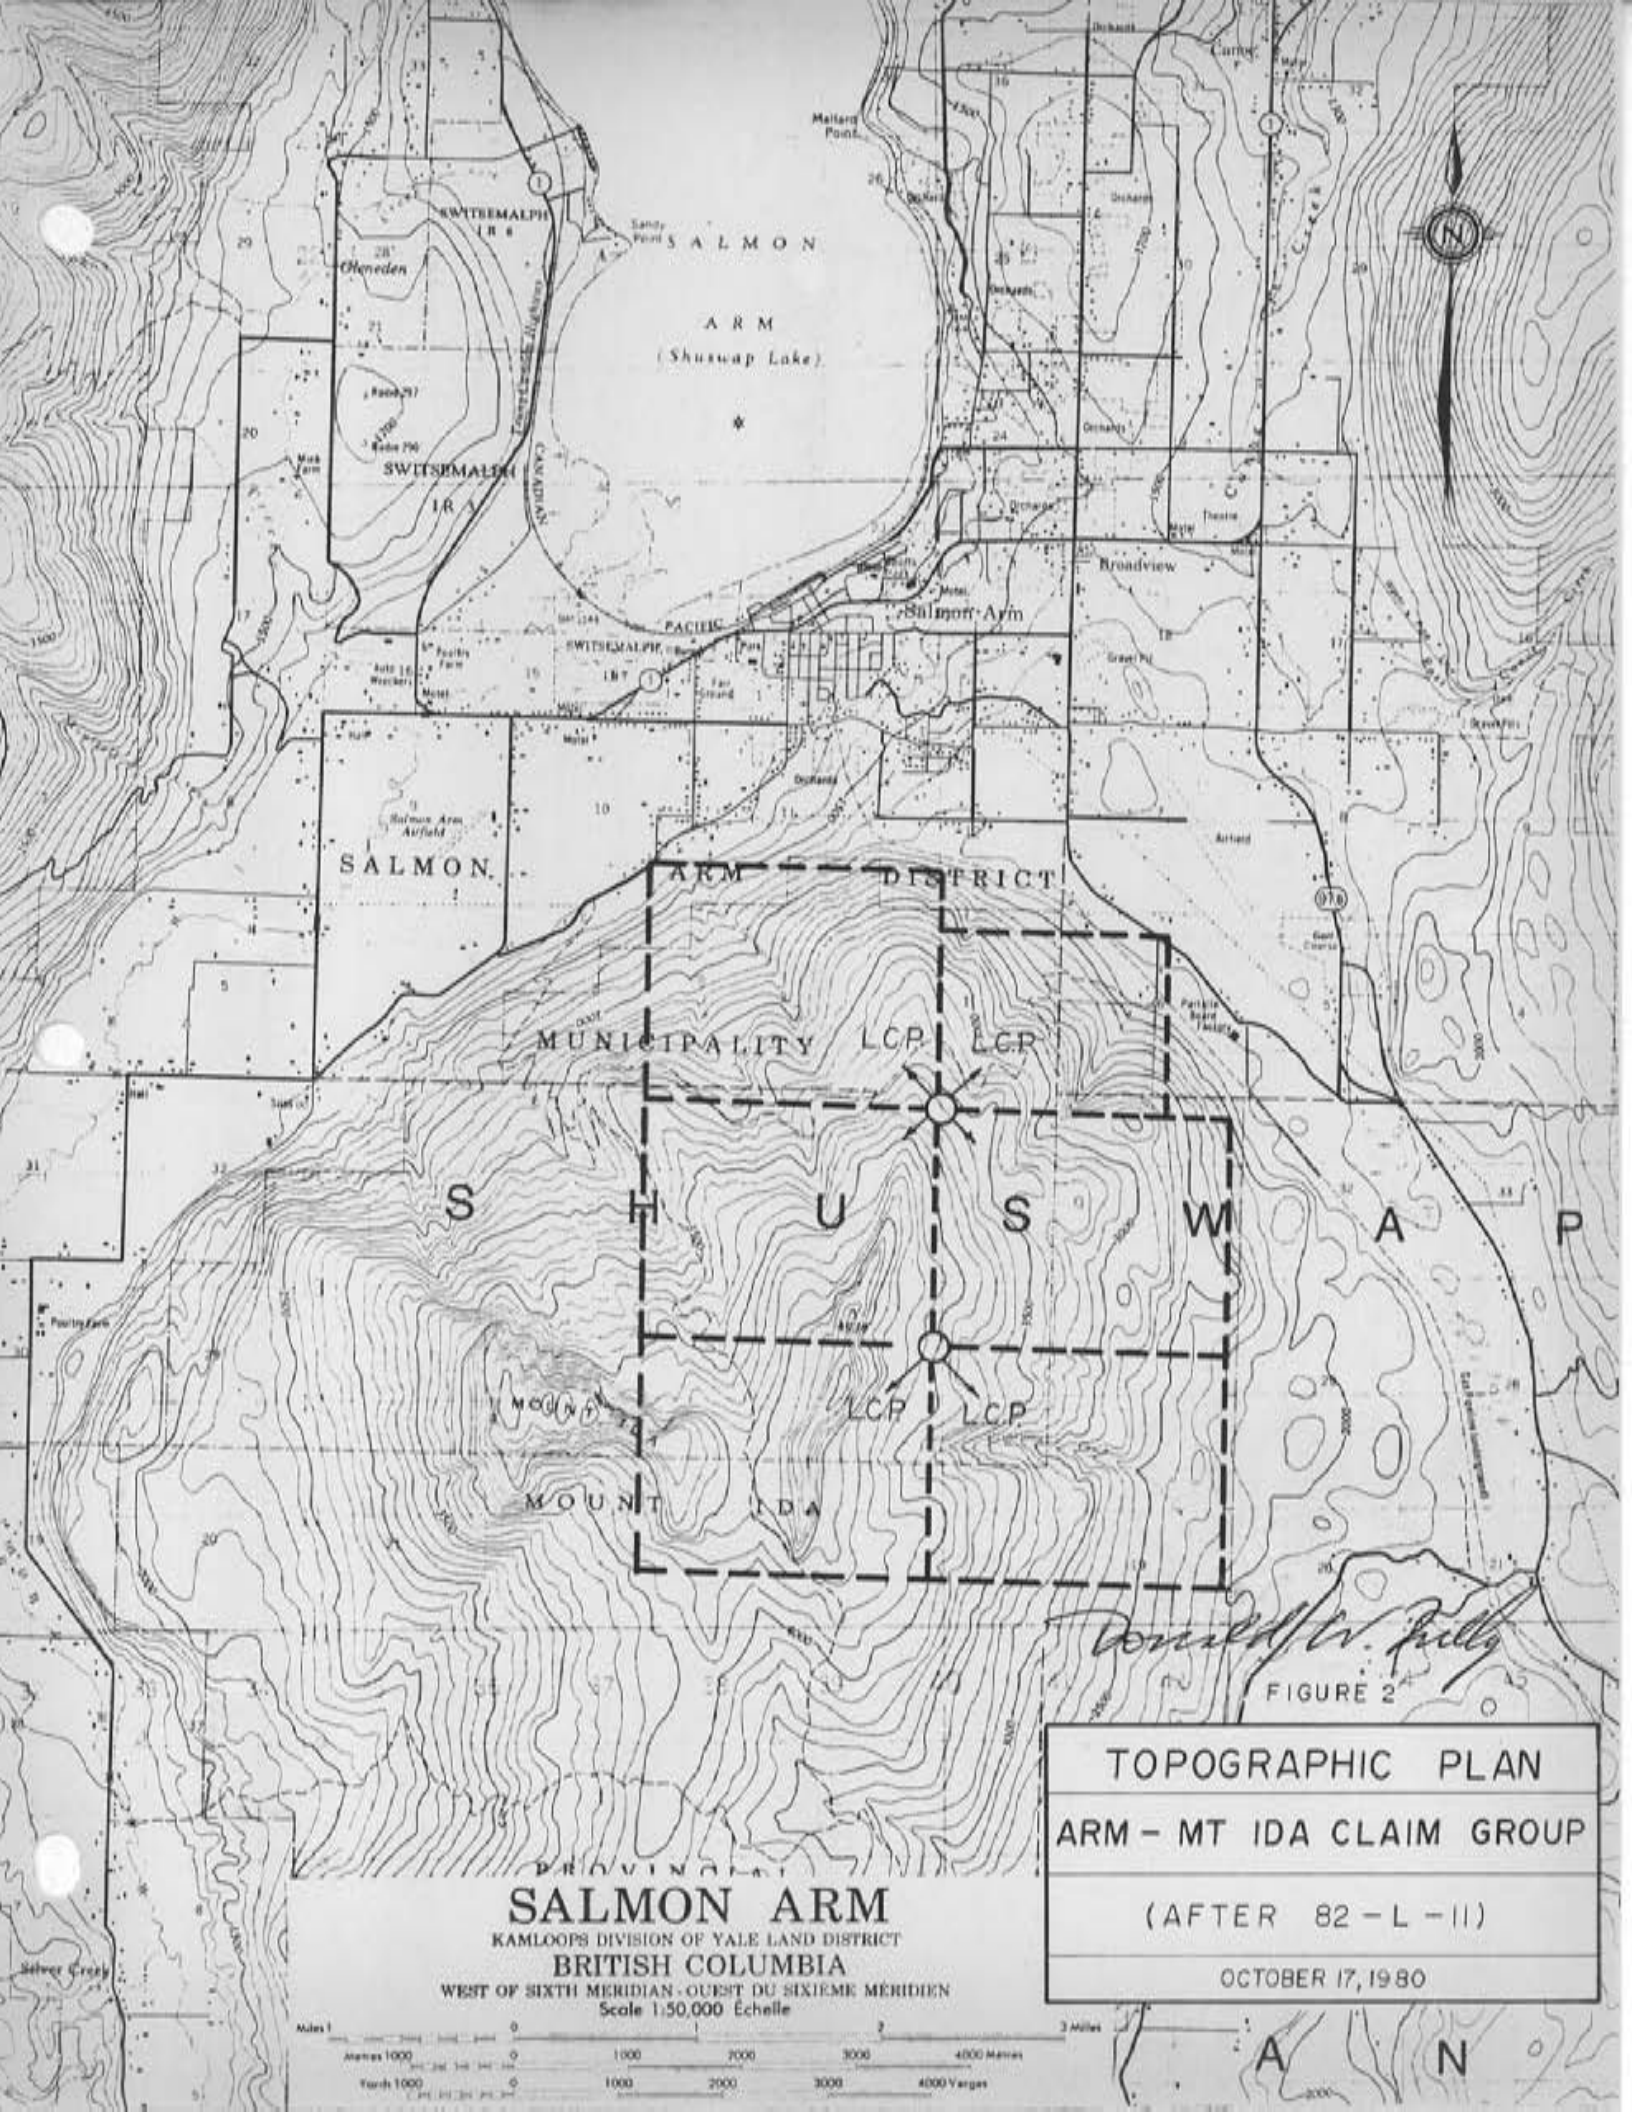

A program of mineral exploration is recommended.

## SUMMARY AND CONCLUSIONS

The ARM-IDA property is a gold-silver and base-metal prospect. There are indications platinum may be present in the claim area.

The ARM-IDA claim group consists of six mineral claims comprising 112 units covering an area of 2,800 hectares located immediately south of the Town of Salmon Arm, British Columbia. Motor vehicle access is available over portions of the property using four-wheel drive.

The history of the property dates back to the early 1900's when highgrade silver boulders were discovered a short distance south of Salmon Arm. The Mount Ida group of mineral claims were developed intermittently around the years 1905, 1913-14, 1926 and 1930. Since that time the

property appears to have been idle, according to the record. Exploration work on the claims consisted of underground crosscutting and drifting, mostly on the Everglade claim of the Mount Ida group. The location of the mineral showing is not clear but several gold-silver, galena and sphalerite occurrences in quartz-filled shear zones are indicated in the record. The precious metal, platinum, is of interest and is mentioned at three different claim locations, the Everglade, White Cliff and the Mountain View, by separate authors. However, ultrabasic rock is not mentioned in the literature covering the claim area.

A geochemical soil sampling survey was done over the claim area in July, 1980. The results showed anomalous values for silver, lead and zinc in northeast and east-central sectors of the property. The cost was \$17,901.65.

It is concluded the ARM-IDA mineral claim group area is underexplored and appears to be an excellent exploration bet in a favourable geological environment which warrants a program of exploration to develop mineral targets.

#### PROPERTY - LOCATION, ACCESS, PHYSIOGRAPHY

The property is located in the Salmon Arm District Municipality about 500 metres south of the Town of Salmon Arm, Kamloops Division of the Yale Land District in the Kamloops Mining Division. Highway No. 1 traverses the northwest and northeast corners of the claim area (Figure 2).

The property comprises six mineral claims, namely the ARM #1 and #2, and the IDA #1 - #4 inclusive. The

six claims contain 112 units and the total area is 2,800 hectares.

The topography over the claim area is relatively steep and varies between 2,000 and 5,000 feet above sea-level. Trails occur over the northern and southern sectors of the property area and require four-wheel drive vehicle transport (Figure 2).

Most of the claim area is covered with forest.

### CLAIMS

The ARM and IDA mineral claims are recorded with the British Columbia Ministry of Energy, Mines and Petroleum Resources at Kamloops, British Columbia as follows:

<u>Claim Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Record Date</u>	<u>Recorded Holder</u>
ARM #1	20	2513	April 8, 1980	Ware Resources Ltd.
ARM #2	12	2514	April 8, 1980	Ware Resources Ltd.
IDA #1	20	2515	April 8, 1980	Ware Resources Ltd.
IDA #2	20	2516	April 8, 1980	Ware Resources Ltd.
IDA #3	20	2517	April 8, 1980	Ware Resources Ltd.
IDA #4	<u>20</u>	2518	April 8, 1980	Ware Resources Ltd.
	<u>112</u>			

The ARM and IDA mineral claims are believed to be contiguous and are shown on British Columbia Mineral Claim Maps M82-L-11E and 11W. Portions of ARM #2 and IDA #2 are under mineral reserve to the Salmon Arm-Enderby Proposed Transmission Line. The ARM #1 claim is in apparent contravention of a prior claim located astride Leonard

and Hobson Creeks in the northwest part of the claim area (Figure 3). A survey of the perimeter of the claim area is recommended to establish the property boundary and the respective relationship to any surface rights particularly along the north and east sectors of the claimed ground.

#### HISTORY - PREVIOUS DEVELOPMENT AND MINERALIZATION

In 1904, a Mr. F.A. McLeod staked the Mount Ida mineral claim over highgrade silver boulders found some four miles (7 km) south of Salmon Arm on the northwest slope of Mount Ida. This event is described in the Minister of Mines report for the year 1905. This find was indicated to have come from a vein located at right angles to a stream bed and was reported tested by several cross-cuts for a length of 38 feet. In 1913, the Mount Ida claim group was reported to consist of five mineral claims namely, the Everglade, Excelsior, Leah Rose, Alida and Eva. These claims were indicated to be located some 1,000 feet above Shuswap Lake and some five miles (8 km) south of the Town of Salmon Arm. It is the writer's opinion this description places the location of these claims in the area of the present IDA #4 mineral claim. The following is a resume of the development of the Mount IDA claim group at that time by W.M. Brewer:

" The rock formation in the immediate vicinity belongs to the rock classed by Dr. Dawson as the "Shuswap Series", made up of mica-schist, grey gneiss, crystalline limestone and quartzites. In this occurs a system of parallel ore-bodies, from 18 inches to

 PROVINCIAL

" 7 feet wide, composed of galena in a quartz gangue; these appear sometimes to be contact deposits between the micaceous schist and quartzite, and at other places between the schist and marble. The strike of these generally is approximately north-east, and dip from an angle of 65 degrees to almost vertical towards the south-east.

All the development-work has been performed on the Everglade mineral claim, and consists of 346 feet of underground work, as follows: Upper adit 130 feet long, at an elevation of about 1,000 feet above the lake; this crosscuts the mica-schist formation for about 100 feet, then a seam of quartz between 6 and 7 feet wide carrying quite an appreciable percentage of galena, then limestone forming the footwall. From this point a drift has been run, but, owing to caving of the roof from slacking, this could not be closely examined; however, I was able to take a sample from the face typical of the ore-body, but not intended to represent an average of the entire ore-body as it would be mined. This sample assays: Gold, trace; Silver, 7 oz per ton.

A lower adit has been driven 230 feet with the intention of driving under the upper adit, at a vertical depth below it of about 260 feet, but has not yet been driven sufficiently far to reach the point aimed at. Near the face of this adit the water that percolates through the strata and cleavage-planes of the country-rock is blood-red, evidently from iron stains, and there is also a considerable quantity of iron-pyrites disseminated through portions of the rock,

" apparently indicating that a mineralized zone might be looked for as the work progressed. At the portal of this adit a body of quartz carrying some galena was exposed, but this had the appearance of having been broken off and having slipped from a higher elevation.

An ore-body outcrops at a point about 50 feet vertically above the upper adit, where a shaft was sunk 16 feet deep, in which is exposed a quartz vein, 18 inches wide, carrying galena; it is apparently wider on the north-east side of the shaft than on the south-west side. It is doubtful whether this is the same orebody as is exposed in the upper adit, although it may be.

Two other outcroppings of the same character of ore occur, one at about 100 feet lower elevation than the shaft referred to, and another about 60 feet still lower down the mountain, but a short distance north of a direct line between the two last mentioned. On the first of these a shallow open-cut has been made while on the last named there is an open-cut and shaft; this has been sunk about 15 feet deep below the bottom of the cut, in which is exposed an ore-body about 3 feet wide of quartz carrying galena. "

Mr. W.F. Ferrier, reporting for the Munitions Resources Commission, Canada, in the final report dated 1920, indicated the presence of platinum at Mt. Ida. Mr. Ferrier reported the first claim sampled was the White Cliff claim on the northeast slope of Mt. Ida at an

elevation of about 3,150 feet. This elevation does not agree with that of Mr. W.M. Brewer in his report of 1913 but the description of the workings is somewhat similar. Ferrier obtained two samples, from what he has indicated may be the Everglade claim, that assayed as follows:

<u>Sample No.</u>	<u>Claim</u>	<u>Description</u>	<u>Gold Oz/Ton</u>	<u>Pt Oz/Ton</u>
5	Everglade (?)	Miller Tunnel width 4.75 ft. Across face	0.24	0.02
6	Everglade (?)	Miller Tunnel Mineral streak in face 1½ in- ches wide	0.14	0.03

O'Neill and Gunning, in a report contained in the Geological Survey of Canada Economic Series No. 13 on page 103, referred to the investigations by Mr. Ferrier and also reported that samples taken from the Mountain View Claim across widths of 8.5 feet and 2.5 feet, respectively, assayed 0.20 and 0.02 ounces of platinum. Sheared zones carrying quartz stringers with attendant sphalerite, galena, chalcopyrite and pyrite were also noted and the sample results from the shears were said to carry small amounts of platinum and interesting amounts of gold.

In 1926, the Bonnie Brae group of four claims were reported on by the Minister of Mines for that year. This group was said to be located on the north slope of Mount Ida about 1,500 feet above the valley of the Salmon River (1,200 feet) apparently in the area of Hobson Creek near the common boundary of ARM #1 and IDA #1 mineral

claims. The description given is as follows:

" The mineral occurrences on this group are represented by extensive bodies of quartz, containing pyrite and some blende and galena carrying silver values and a little gold. This quartz occurs in zones of shearing and fracturing in impure quartzites and schists, traversed by dykes of feldspar porphyry. A number of open-cuts strung out in a general direction of N 60° E (mag.) exposes a series of these quartz-bodies varying up to 6 feet in width, which appear to lie within a dominant zone of fracturing. The most north-easterly of these open-cut exposures lies at a vertical distance of about 250 feet above the bed of Hobs creek (locally known as Hobson creek), which follows an oblique course down the slope of the mountain in a northwesterly direction. From a point on the steep bank of this creek, lying almost due north from the outcrop above mentioned, a tunnel has been driven for a distance of about 70 feet in a general southerly direction, following the course of a porphyry dyke which lies on the western side of a zone of shearing, having a dip of about 50° to the north-east. The ground in the neighbourhood of the dyke is much disturbed and the width of the zone cannot be stated definitely; a characteristic feature is the inclusion of bodies of quartz, one of which is also exposed in the bed of the creek about 50 feet farther to the east, indicating a width of about 50 feet farther to the east, indicating a width of about 50 or 60 feet for the zone. The new work above referred to was done on the Foothill in a canyon of the same creek at a distance of approximately three-quarters of a mile to the north-west of

" the upper workings of the Bonnie Brae group and about 1,200 feet below them. A zone of shearing in the same schist and quartzite formation is exposed in open-cut workings at a sharp bend of the creek. This zone has a north-westerly strike and a dip of about  $50^{\circ}$  to the north-east, and the inclusion of quartz associated with a considerable amount of pyrite is in all respects similar to that found in the upper workings. It is indicated that the two sets of workings are on the same zone of shearing, which is in all probability responsible for the direction taken by the creek in its oblique course across the hillside occupied by a hard quartzite formation.

In these lower workings there is also a considerable amount of massive pyrrhotite on the footwall side of the zone, and this is not without significance, occurring as it does at the lowest point at which this apparently persistent shear has been exposed. The upper line of outcrops above referred to, following a north-easterly direction, appear to occupy fractures in a greatly disturbed section of the formation intersected by the porphyry dykes, and all these occurrences are to be referred probably to a main source of mineralization along the shear zone. The whole base of Mount Ida is underlain by granite, and it is in this connection that the occurrence of heavy sulphide mineralization in the lower workings is held to afford some encouragement for further development along the line of shearing in the overlying quartzite. The following samples were taken:

" A picked sample of quartz from the face of the 70-foot tunnel: Gold, trace; silver, 12 oz to the ton. Quartz from Foothill: Gold, trace; silver, trace. Quartz on hanging-wall of shear in 70-foot tunnel: Gold, trace; silver, 0.6 oz to the ton. Quartz from upper open-cuts in crossfractures: Gold, trace; silver, 6 oz to the ton. Pyrrhotite from Foothill: Gold, trace; silver, trace; zinc, trace.

Sunset:

This group of eight claims is situated on Mount Ida, near Salmon Arm. Two main veins occur on the property; the lower vein was developed to some extent several years ago and carried values in silver and lead. The upper vein has been reported to carry values in gold and platinum, but no further information is available in regard to this occurrence than was furnished in the account given by W.F. Ferrier and published in the Final Report of the Munition Resources Commission in the year 1920.

The property is now owned by Sunset Mines, Limited, with head office in Salmon Arm, and it is understood that further work is to be commenced during the coming year. "

Information on the Gertrude Group of Mineral Claims (Figure 6) is believed to be the former Mount Ida property and the information contained in the reports by Brewer and Ferrier appear to be relevant.

A geochemical soil sampling survey was carried out over the claim area in July 1980. The tunnel was opened up in August-September, 1980.

## REGIONAL AND LOCAL GEOLOGICAL SETTING

According to Geological Survey of Canada Map 1059A (Vernon Area) the claim group is underlain by five distinct lithological units, which are the Silver Creek, Mara and Sicamous formations intruded by the Coast Intrusions of acidic rocks and overlain by the Kamloops Group of Tertiary basaltic lavas. A tentative geologic timetable is as follows:

<u>Formation</u>	<u>Description/Event</u>	<u>Age</u>
Sand, gravel, loam deposits	Unconsolidated  (Erosional unconformity)	Quaternary

*Donald W. Hilby*

FOR LOCATION  
 SEE FIGURES 8, 9, 10  
 Revised October 17, 1980

<u>Formation</u>	<u>Description/Event</u>	<u>Age</u>
Mineralization and attendant quartz veining	Silver, gold, (platinum ?) and associated sulphides of lead, zinc and iron  (Tectonic activity)	(Tertiary ?)
Kamloops Group of volcanics	Basaltic lavas  (Tectonic activity)	(Miocene ?)
Coast Intrusions	Granite, granodiorite  (Erosional unconformity and tectonic activity over several eons of time)	Jura-Cretaceous
Sicamous Formation (Shuswap Terrane)	Limestone and several schist facies	(Proterozoic ?)
Mara Formation	Calcareous and pelitic sediments and schist facies	(Proterozoic ?)
Silver Creek Formation	Quartz-sericite-biotite schist facies with calcareous horizons	(Proterozoic ?)

Structurally, the lineal elements of fracturing and schistosity trend both northeast and northwest. The northeast schistosity trend appears dominant in the earlier underlying schist facies of the Shuswap Terrane Complex while the northwest trend of fracturing is evident in the later lithological units (Figure 4).

Two north-northwest striking fault zones are shown traversing the claim area suggesting a fault contact between the Silver Creek, Mara and Sicamous formational units. A major through-going fault zone trends northwesterly

along the area of Hwy 97B between Salmon Arm and Enderby just east of the claim area (Figure 4).

A sizeable magnetic "Low" occurs in the area of IDA #3 Claim (Figure 5). A study of Figure 5 suggests both northeast and northwest bedrock structural trends are reflected thereon.

#### GEOCHEMICAL SOIL SURVEY - 1980

The period of the field survey was July 10th through August 5th, 1980.

The geochemical soil survey was based on a grid over the claim area of east-west flagged lines controlled by pace and compass from a central north-south base line (Figures 8, 9, and 10. Soil samples were taken at 100-metre intervals along the east-west lines. Detail-sampling was done in detail in the area of Line 20+00 North, 700 East (Figure 7).

A total of 1,129 soil samples were taken and analyzed for silver, lead and zinc. The assays are plotted on Figures 7, 8, 9 and 10. A study of the results of the analyses shows:

	<u>Range of Results</u>	<u>No. of Samples</u>
<u>Zinc</u>	0 - 50 ppm	140
	51 - 100 ppm	650
	101 - 150 ppm	218
	151 - 200 ppm	78
	200+ ppm	43

	<u>Range of Results</u>	<u>No. of Samples</u>
<u>Lead</u>	0 - 19 ppm	577
	20 - 39 ppm	476
	40 - 59 ppm	57
	60+ ppm	19
<u>Silver</u>	0.0 - 0.5 ppm	930
	0.6 - 1.0 ppm	180
	1.1 - 2.0 ppm	14
	2.1+ ppm	5

The variations in the pH of the soil cover over the property has not been determined.

Silver values are anomalous in the area of Line 20+00N at 700E as shown in detail on Figure 7. Anomalous values in silver occur on Line 12+50N at 5+00E through 11+00E, Line 17+50N at 3+00E. Detail soil surveys in the area of L2+50N at 1+00E and 5+00N at 4+00E should be done.

Lead is evidently a companion of silver as indicated in the analyses plotted on Figure 7. The results for Lead over the claim area (Figure 10) show anomalous assays that should be followed up with detail surveys at the following locations:

Line 2 + 50 S	at	22 + 00E
Line 0 + 00	at	9 + 00W
Line 15 + 00 N	at	22 + 00E
Line 17 + 50 N	at	3 + 00E
Line 27 + 50 N	at	6 + 00E
Line 35 + 00 N	at	8 + 00E

Zinc results are plotted on Figure 9. Generally anomalous zones trend southeasterly across the claim area from Line 17+50N at 6+00E through 17+00E towards Line 0+00 at 13+00E. More detail surveying could develop a zinc anomaly of merit in this sector of the claim area.

### RECOMMENDATIONS

A three-phase program of mineral target preparation is recommended for the claim area.

#### Phase I

A survey of the perimeter of the ARM-IDA mineral claim group is proposed to establish boundary and ownership of any surface rights to the claimed area as well as any prior mineral claim rights.

A photogeological study is proposed for the claim area on scale say 1:200 metres.

Geological mapping is recommended over the claim area.

Detailed geochemical soil surveys are proposed in the following areas:

- 1) Silver - Expand the program of detail soil sampling already carried out as shown on Figure 7 in a north-northwesterly direction.

Do detail soil surveys in the area of L2+50N at 1+00E, L5+00N at 4+00E, L17+50N at 3+00E.

2) Lead - Do detailed soil sampling surveys in the area of

L 2 + 50S at 22 + 00E  
 L 0 + 00        9 + 00W  
 L15 + 00N at 22 + 00E  
 L17 + 50N at 3 + 00E  
 L27 + 50N at 6 + 00E  
 L35 + 00N at 8 + 00E

3) Zinc - The area surrounded by points at L0+00 at 13+00E and L17+50 at 6+00E through 17+00E is proposed for detailed soil sampling.

#### Phase II

Four BQ core size wireline diamond drill holes each 100 metres in depth are proposed to test the area of old underground workings shown on Figure 7.

#### Phase III

Dependent on the results of the exploration program from Phases I and II and contingent upon an engineering evaluation recommending a program of further diamond drill testing, it is proposed to drill five BQ core size wireline diamond drill holes, each 100 metres in length, in the areas of the indicated Lead and Zinc anomalies.

ESTIMATED COST OF THE PROPOSED WORK PROGRAM

Phase I

Survey the perimeter of the ARM-IDA mineral claims using chain and compass and a land study to establish surface rights ownership (22 km @ \$125/km = \$2,750 plus study time)	\$ 5,000
Preparation of a base map from photo enlargements on scale 1:200 metres and photogeological study covering claim area (2,800 hectares)	5,500
Detailed geochemical soil sampling in the recommended areas for Silver, Lead and Zinc (350 samples x \$10/sample)	<u>3,500</u>
Estimated Cost Phase I	\$14,000

Phase II

Four BQ core size wireline diamond drill holes each 100 metres in length (4x100m = 400m x \$80/metre)	32,000
Mobilization, demobilization, core-handling, assaying, supervision, travel, engineering report	<u>6,400</u>
Estimated Cost Phase II	<u>38,400</u>
Carried Forward	\$52,400

Brought Forward \$ 52,400

Phase III

Five BQ core size wireline diamond  
drill holes each 100 metres in  
length

(5x100m = 500 m x \$80/metre) \$40,000

Mobilization, demobilization, core-  
handling, assaying, supervision,  
travel, engineering evaluation

8,000

Estimated Cost Phase III 48,000

Estimated Total Cost  
Phases I, II and III \$100,400

Respectfully submitted,

Donald W. Tully, P. Eng.

October 17, 1980

CERTIFICATE

I, DONALD WILLIAM TULLY, of the City of West Vancouver, Province of British Columbia, hereby certify as follows:

- 1) I am a Consulting Geologist with an office at Suite 102, 2222 Bellevue Avenue, West Vancouver, B.C.
- 2) I am a registered Professional Engineer of the Provinces of British Columbia and Ontario.
- 3) I graduated with a degree of Bachelor of Science, Honours Geology, from McGill University in 1943.
- 4) I have practiced my profession for thirty-five years.
- 5) I have no direct, indirect or contingent interest in the ARM 1, 2 and IDA 1-4 mineral claim group, subject of this report, nor do I intend to have any interest.
- 6) This report dated October 17, 1980 is based on an examination made on July 28, 1980, a knowledge of the Salmon Arm area and from information gathered from available maps and reports. I was not involved in the geochemical soil survey field program.
- 7) Written permission from the author is required to publish this report dated October 17, 1980 in any Prospectus or Statement of Material Facts.

DATED at West Vancouver, Province of British Columbia, this 17th day of October, 1980.

Donald W. Tully, P. Eng.,  
Consulting Geologist
