INTRODUCTION

At the request of V. Wilson, Secretary of Texacana Resources Limited, the writer examined and sampled some of the accessible underground workings on the Sky Group and adjoining claims on November 10, 1980, in the company of C. Ashworth. A heavy snowfall during the preceeding day deposited more than 50 cm of snow at the elevation of the workings, making evaluation of the bedrock geology beyond the portal areas impossible. During the previous week, Mr. Ashworth's crews completed 29 km of soil sampling on the claims, with 50-m sample intervals on lines at 100-m spacings.

Following evaluation of the soil sampling and limited underground sampling results, the writer prepared a "Report on the Sky Group" dated January 22, 1981 for Texacana, and recommended a 2-stage exploration program totalling \$130,000 to attempt to define mineable ore on the property.

Air photo linears were plotted and analyzed, and correlated both with soil sample anomalies and with previously mapped faults. A brief memo report concerning the photogeological interpretation was prepared for Texacana dated February 26, 1981.

The Sky Property, shown on Figures 1 and 2, is in the Similkameen Mining Division, southwestern B.C., 42 km west of Princeton and 26 km easterly of Hope in the Hoza-meen Range of the Cascade Mountains. The geographic location is 49°25' north latitude and 121°04' west longitude.

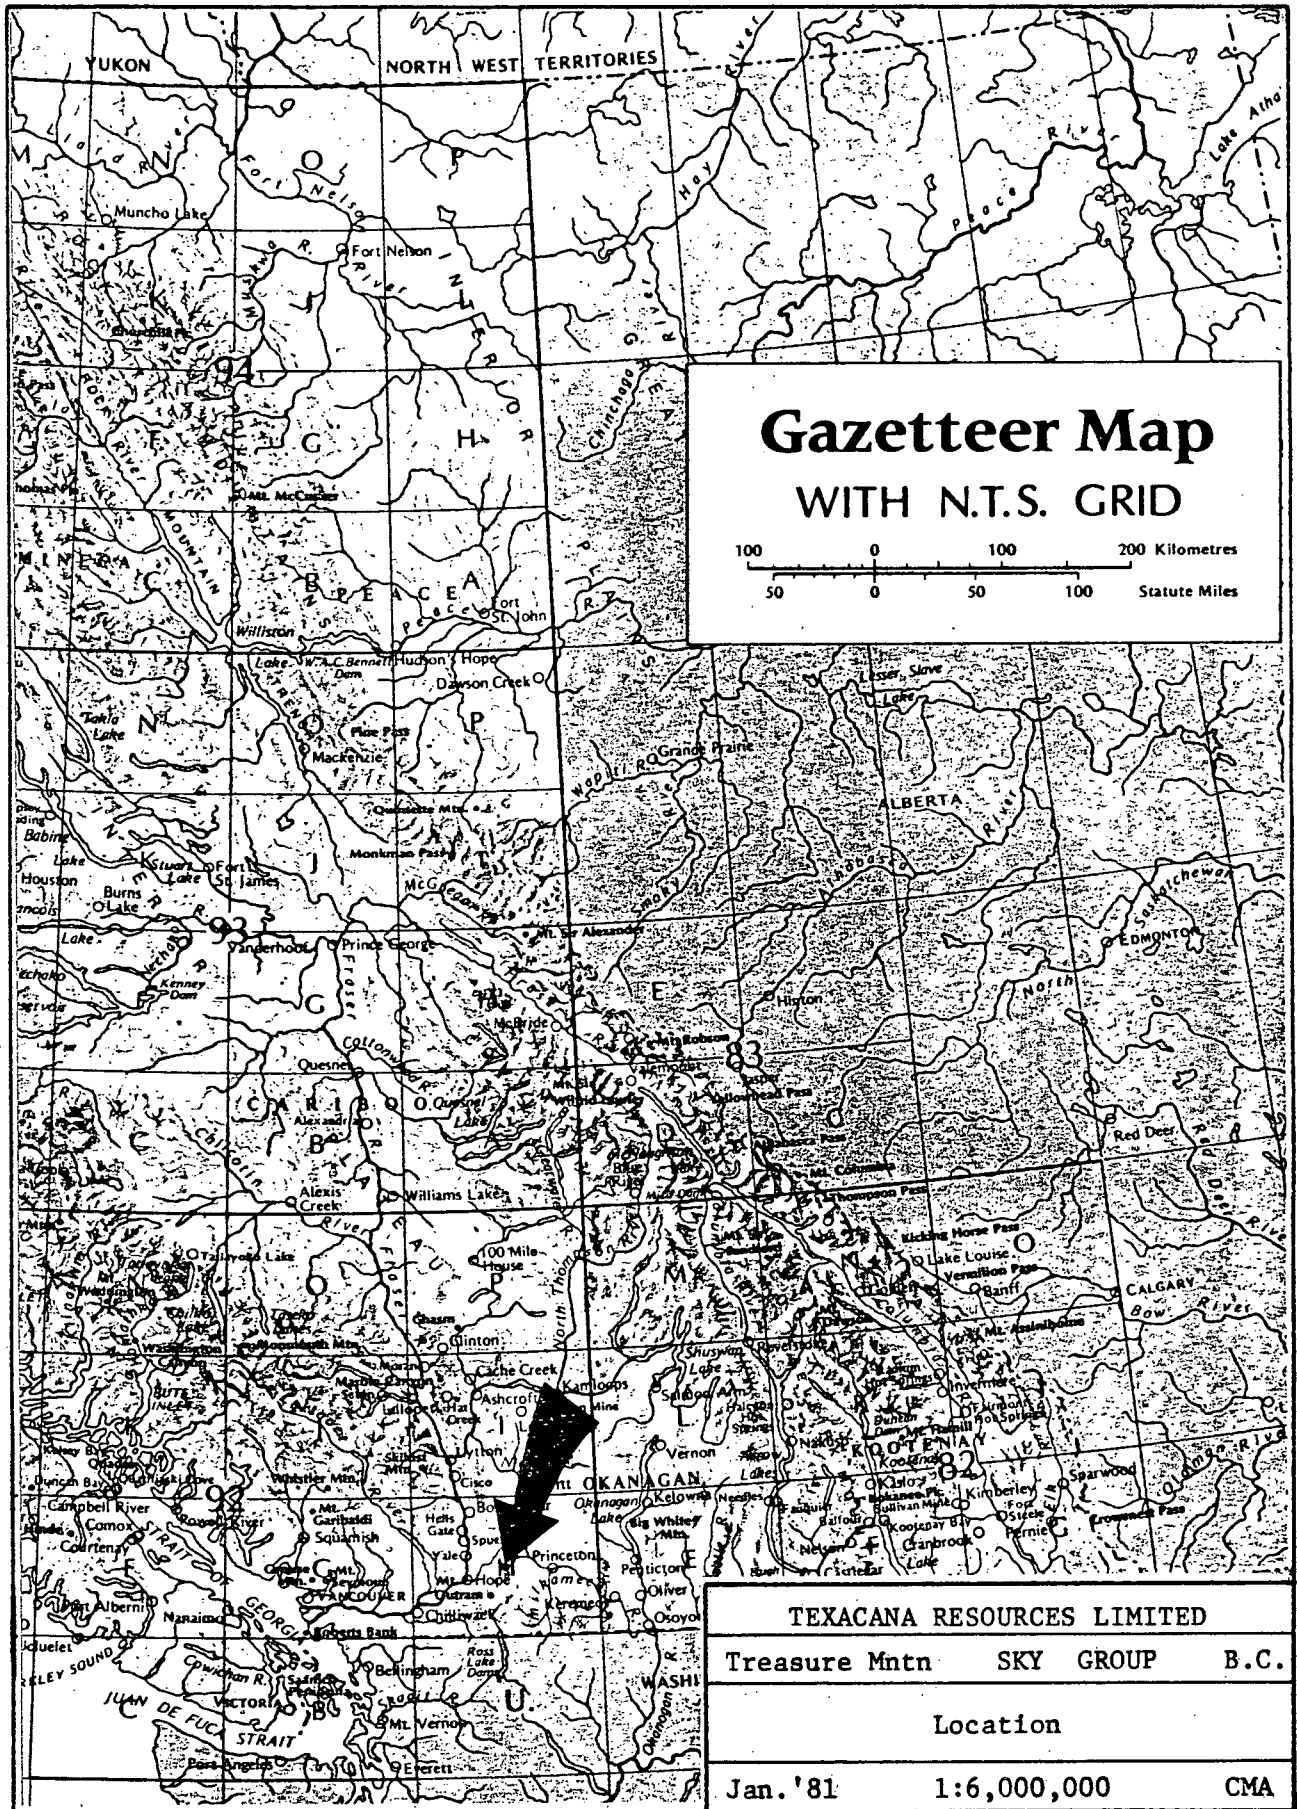

Access to the claims is via 33 km of fairly good gravel road westerly from the village of Tulameen along the north bank of the Tulameen River and Vuich Creek (a principal branch of the Tulameen River).

Figure 2 shows the current Texacana claim holdings in the Treasure Mountain area, Similkameen Mining Division. The claims are held by Texacana, as operator, under an option agreement dated October 22, 1980 with Tarbo Resources Limited. Three other claims are held by Texacana under separate option agreements. Significantly, the 5 crown grants were the first 5 claims staked in the Treasure Mountain area in 1894 and 1896.

The writer examined the common legal corner post (LCP) of the recently staked Sky and Spike claims, and verified that the boundary lines were marked properly for short distances north, south, and west of the LCP.

As tabulated below, the Sky Property is comprised of 28 claims and units in 3 non-contiguous groups, Sky (Sutter, Skyline, Sky - 17 units and claims), Spike (Spike - 8 units), and VEL (Vigo, Eureka, Lulu - 3 claims), the groupings being dictated by intervening portions of claims held by other parties.

The first discovery of Ag-Pb-Zn mineralization in the Treasure Mountain area, more commonly referred to as Summit Camp, was by C. Connelly in 1894, and he recorded the Eureka claim in that year. In 1895, F. Sutter discovered a number of other interesting mineral occurrences, and, in 1896, Sutter and J. Amberty staked the Vigo, Lulu, Sutter, and Skyline claims. All of these claims now form part of Texacana's Sky Property.

Little exploration work, beyond the requirements for assessment purposes, plus additional claim staking, was conducted until 1906, when the Silver Chief lode was discovered on Treasure Mountain. Much of the surface and underground exploration work in the area was completed in the interval to 1913.

Between 1920 and 1932, exploration activity was sporadic on the diverse claim-holdings in the area. Most activity, including hand sorting, pilot plant milling, and shipment of concentrates to the Trail smelter, was conducted on the Silver Chief group of claims: approximately 40,000 oz Ag, 380,000 lb Pb, and 90,000 lb of Zn were shipped to Trail. From the Eureka claim, 43 tons of sorted ore were shipped averaging 20.3 oz Ag/T, 14.9% Pb, and 15.8% Zn.

The Silver Chief and Eureka claim groups were developed further in the period from 1950 to 1957, including installation of a 50 tpd mill. The mill operated for only a short period during the winter of 1956/57, one carload of zinc concentrate was shipped to the Trail smelter, and the mill was dismantled and moved out in mid 1957. This coincided with a period of relatively low base and precious metal prices.

In 1970, Copper Range Exploration conducted an exploration program on the Silver Chief group involving underground mapping and sampling, magnetometer surveying, some soil, silt, and rock geochemical sampling, and trenching.

Linecutting: Clive Ashworth Exploration Services completed 29 km of horizontally chained and flagged line utilizing 50-m stations on lines at 100-m spacings for Texacana during October and November, 1980. Due to the difficulty of locating the old claim posts in the field, and of establishing the old claim boundaries, substantial overlap of other claim holdings occurred.

The writer's best estimate of linecutting on Texacana's claims is more than 14 km, or approximately 50% of the total grid completed.

Geochemical survey: Clive Ashworth Exploration Services collected 456 soil samples on the Sky Property which were analyzed for Pb and Zn.

The writer collected 6 representative chip samples from the underground workings which were analyzed for Cu, Pb, Zn, Ag, and Au.

Air photo linears in the claims area were plotted and evaluated by the writer.

The above surveys covered portions of each of the 4 claims (Sutter, Skyline, Sky, Spike) in the non-contiguous Sky and Spike Groups. Of the total \$16,600 expenditure on the Sky Property, \$12,521 represents the expenditure calculated for the Sky and Spike Groups.

GEOCHEMICAL SURVEY

The "B-zone" soil horizon generally is quite well developed in the well-drained ferro-humic podsoils making soil sampling an effective exploration technique for the widespread, overburden-obscured areas.

Pertinent geological data is as follows: The Sky Property is underlain by sedimentary rocks of the Upper Jurassic Dewdney Creek Formation, and the Lower Cretaceous Pasayten Formation, both striking generally northwesterly and dipping southwesterly at 40° to 80°.

The Dewdney Creek Formation is comprised of tuff, breccia, and agglomerate, with interbedded argillite and conglomerate; and the Pasayten Formation is comprised of arkose, argillite, and conglomerate.

Both formations are intruded by numerous sills and dykes, varying in composition from diorite to gabbro, and including frequent lamprophyres. The intrusives vary from 0.1 m to 10 m in width, and from 1 m to 300 m in length. The largest diorite sill is about 200 m wide by 1200 m long. Younger feldspar porphyry dykes cut the diorite, as well as all older rocks, but precede the mineralized vein material.

Black states that "the Treasure Mountain fault is the major fault in the area", striking generally east northeast through the area and dipping from 30° to 65° southerly. Numerous other less prominent faults in the area, Indiana, Queen Bess, Ridge, and Sutter Slope, may be related in age and origin to the Treasure Mountain fault.

All veins with heavy to massive lead-zinc mineralization, and a variable proportion of quartz and carbonate gangue mineralization, occur in the above-mentioned faults, or in other similar faults. Faulting, thus is the principal ore control in the area.

The galena mineralization is argentiferous (150 to 600 oz Ag/T in "pure galena), reportedly due to microscopically disseminated argentite, although small amounts of tetrahedrite also have been identified. Sphalerite, pyrite, pyrrhotite, and arsenopyrite, in approximate order of abundance, are common associated sulphide minerals; and, chalcopyrite and stibnite also occur locally. Gold values rarely exceed 1 g/t (0.03 oz/T).

"B-zone" soil samples were taken at depths ranging from 5 to 20 cm at 50-m intervals on the 29 km of line, totalling 456 samples, coarse-screened by hand, and packaged in heavy kraft paper envelopes. Analyses were conducted by Acme Analytical Laboratories in Vancouver: the samples were dried, sieved to -80 mesh, weighed, dissolved in hot aqua regia, diluted, and analyzed for Pb and Zn by atomic absorption spectrophotometer, including background corrections.

Analytical results and graphical statistical calculation are included in Appendices I and II, respectively. Figures 3 and 4, show the results of the soil sampling survey on the Sky Property for Pb and Zn, respectively. The major faults mapped by Black (1952) also are shown.

Figure 5 is a copy of the air photograph covering the Sky Property, on which all of the prominent air photo linears have been drawn using stereoscopic examination. The scale is approximately 1:20,000. The known showings have been circled, and the faults named by Black (1952) are identified. A profusion of bedrock fractures occur parallel to the major fault directions.

All of the known showings appear to fall along prominent air photo linears, chief of which is the ENE-WSW direction manifested in the Treasure Mountain, Queen Bess, and Sutter Slope Faults. In addition to the E-W Indiana Fault direction and the NNE-SSW Ridge Fault direction, ESE-WNW, and N-S fracture directions also are prominent. While Ag-Pb-Zn mineralization in the area has been noted with all of the above strike directions, it is apparent that significant mineralization occurs only locally.

Anomalous Pb and Zn soil values occur between the Sutter Slope and Indiana Faults, and may be related to E-W faulting. The broad anomaly on the 7N tie line should be delineated with additional linecutting and soil sampling to the north, and all other anomalous areas should be evaluated on the ground to attempt to establish the source of the values. Fill-in soil samples should be taken where local conditions dictate.

CERTIFICATION

I, CHRISTOPHER MACKENDRICK ARMSTRONG of the City of Vancouver, Province of British Columbia, do hereby certify:

THAT I am a practicing Geological Engineer residing at 4085 West 29th Avenue, Vancouver, British Columbia, V6S 1V4, Canada.

THAT I am a registered Professional Engineer in good standing in the Provinces of British Columbia and Ontario.

THAT I received the degree of B.Sc. in Geological Engineering from Queen's University, Kingston, Ontario in 1960, and practiced my profession continuously in the period between leaving university in 1959 and returning to university in 1966.

THAT I enrolled in the Department of Mineral Engineering at the University of British Columbia in 1966, and in the period to 1969 completed course work and research work requirements in an M.A.Sc. program, specializing in bacterial-acid leaching systems; thesis writing was not completed; post graduate courses in economic geology and North American geology also were taken and completed.

THAT since leaving university in 1969, I have practiced my profession both as a Geological Engineer and as a Specialist-Advisor in ambient temperature-pressure leaching systems.

THAT the following is a true record of my employment and experience:

- 1957 4 mos. Junior Geologist. Noranda Mines Ltd. Noranda, Quebec.
- 1958 4 mos. Party Chief. Hollinger North Shore Exploration Co. Ltd. New Quebec and Labrador.
- 1959-1961 2 yrs. Assistant Geologist. Pickle Crow Gold Mines Ltd. Pickle Crow, Ontario. Teck Corporation Ltd.
- 1961-1962 1 yr. Assistant Geologist. Willroy Mines Ltd. Manitowadge, Ontario.
- 1962-1964 2 yrs. Chief Geologist. Metal Mines Ltd. Werner Lake, Ontario. Consolidated Canadian Faraday.
- 1964-1966 2 yrs. Chief Geologist. Tegren Goldfields Ltd. Kirkland Lake, Ontario. Teck Corporation Ltd.
- 1967 ½ yr. Project Geologist. McLeese Lake property, B.C. Geophysical Engineering & Surveys Ltd. Teck Corporation Ltd.
- 1969-1970 1 yr. Laboratory Manager, Chief Geologist, and Consulting Engineer. S. M. Industries Ltd. Vancouver, B.C.
- 1970-1981 12 yrs. Independent Consulting Engineer. Canada, U.S.A., and Mexico.

THAT I do not have any interest, direct, indirect, or contingent, in the securities or properties of TEXACANA RESOURCES LIMITED, or associated companies or individuals,

THAT This report is based on the writer's examination of the Sky Property in the field on November 10, 1980, and on subsequent evaluation of soil sampling analyses and air photography.

Dated at Vancouver this 27th Day of June, 1981

C. M. Armstrong, P.Eng.
Consulting Engineer
