APPENDIX IV COST BREAKDOWN

SUMMARY

A soil geochemical survey was carried out during the period September 6th to October 27th, 1981 on the PM Claim in the New Westminster Mining Division of British Columbia.

The MP Claim consists of 20 units and is located some one and a half km east of Harrison Hot Springs, B.C.

The purpose of the survey was to test and explore the claim for an economical mineral deposit.

The topography of the property is high relief with the western portion being some 1000 feet or +300 meters a.s.l., and the eastern portion being farm land at some 40 feet or some 10 meters a.s.l.

The central portion of the property is a steep slope and difficult to traverse.

There is a southeasterly trending road on the high ground in the western portion of the claim.

The soil sampling survey was conducted using the southwesterly-trending road as a control line to run east-west lines. The E-W lines were spaced 150 meters apart. This survey covered only the high ground on the western portion of the property.

Samples were taken along the lines and road at 150 meter spacing, and are located as plotted on the plans.

The samples were assayed for Mo, Cu, Pb, Zn, Ag, Ni, Co, Mn, Fe, As and Au.

There were minor low intensity assay anomalous concentrations throughout the surveyed area with a higher persistent concentration in the NE portion of the surveyed area.

There are some old underground workings reported in the northeast area, but none were seen during the survey.

An attempt should be made to sample this steep slope and the farm land, and to find the old workings.

The anomalous low intensity area in the northeastern portion of the surveyed area should be examined and detail-sampled to try and find the cause of the concentration of readings.

The property should also be geologically mapped.

This information would assist in determining a future exploration program.

CLAIMS

The MP claim is shown on NTS 92H/5E in the New Westminister Mining Division of British Columbia.

The claim location can be seen on the following claim map and topographic sheet of Harrison Lake, 92 H/5.

SOIL GEOCHEMISTRY SURVEY

Soil sampling was performed on an established grid at 150 meter intervals. The samples were taken with a mattock in the "B" horizon where possible. They were placed in bags and marked for grid location.

The samples were assayed by Acme Analytical Laboratories in Vancouver, B.C. The assays were for Au, As, Ag, Cu, Mo, Pb, Zn, Cd, Sb, Ni and Co. The assay certificates follow after the statistical analyses. The assays are plotted on the plans and enclosed in the report following the statistical analysis.

SURVEY PERFORMED

A line grid and soil geochemistry surveys were conducted on the property during the period September 6 to October 27, 1981. The survey was conducted by Manny Consultants Ltd. with the assistance of:

Maurice Amendolagine

Rob Ferraro

Dave Leskewycz

Peter Leskewycz

Peter Daviduk

E. Amendolagine

The line grid was established on the property using the road, already present on the high ground.

The grid consisted of compass and chain flagging along the road.

E-W lines were surveyed, flagged and tied into the road survey. The survey was completed only on the high ground for control, and samples were taken at 150 meter spacing along the lines and the road.

There were 67 soil samples taken on the property.

DISCUSSION

The samples were assayed for Mo, Cu, Pb, Zn, Ag, Ni, Co, Mn, Fe, As and Au. The assay results are statistically analyzed and plotted following this report.

The plotted assays indicate that there are scattered weak anomalies in the surveyed area.

The area in the northeast part of the survey shows consistent anomalous indications even though the assay results are weak. The area should be further examined.

The remainder of the property should be soil-sampled. This will also tend to check the possible extension of the anomalous indications.

Respectfully submitted,

E. Amendolagine, P.Eng.

Vancouver, B.C.
