INTRODUCTION

The MB claims are located north of Shuswap Lake, near the upper end of Hudson Creek on the southwest side of Angle Mountain. The moderately steep and well forested area is part of the Shuswap Highland Forest. The area is covered by a good growth of Black Spruce up to a diameter of 0.5 metres.

Access is by the Ross Creek Forestry Development Road which runs into Fraser Road which, in turn, joins the main Shuswap Lake Road about two kilometres east of Anglemont, B. C. Logging spur roads provide road access to within 15 metres of the common legal post for the four mineral claims.

The MB Group consists of the MB1, MB2, MB3 and the recently staked MB4 mineral claims. The claims cover a new showing discovered as a result of stripping conducted to extend a logging spur.

Because the property covers a new showing, there has been no previous recorded work conducted on the property. The property consists of the following mineral claims in the Kamloops Mining Division.

Claim Name	Record Number	Record Date
MB1	2896	8
MB2	2897	8
MB3	2898	8

The current owner and operator is Alpine Silver Ltd., 780 - 885 Dunsmuir Street, Vancouver, B. C. V6C 1N8.

The claims are underlain by paleozoic graphitic schists in contact with limestone, dolomite and limy quartzites. A 1.5 to 2 metre wide flatly dipping quartz vein striking west north west contains significant amounts of argentiferous galena. Further south, disseminated galena was noted in dolomitic limestone bands near the contact with the schists. The claims are being investigated for the possibility of the occurrence of economic deposits of lead and silver in

quartz veins or the possible occurrence of replacement type metasomatic deposits near the contact between graphitic schists and limestone.

The work done on the property in August 1982 consisted of a preliminary soil sampling survey. Sixty-four soil samples and one silt sample were collected. The soils were collected along a grid at 50 metre intervals along lines spaced at 100 metre intervals.

A total of 3000 metres of grid was established using a hip-chain and compass. The stations were marked and numbered with orange vinyl tape.

DETAILED TECHNICAL DATA AND INTERPRETATION

The soils were forwarded to Min-En Laboratories Ltd. 705 West 15th Street, North Vancouver, B. C. V7M 1T2. The samples were dried and seived and the -80 mesh fraction was analysed by standard atomic absorption techniques after a nitric, perchloric acid digestion.

The samples were analysed for Mo, Cu, Pb, Zn and Ag. The sample locations were plotted relative to the common Legal Corner Post for the four claims. The geochemical metal values in parts per million were plotted at the corresponding stations at a scale of 1:5000.

The mean and standard deviations of the population was determined for each metal and the following parameters were determined.

Values in ppm

Metal	Mean	Probably Anomalous	Definitely Anomalous
Mo	4	> 9	> 14
Cu	34	> 49	> 64
Pb	37	> 87	> 137
Zn	85	> 116	> 147

Inspection of the sample values indicates an increase in lead, in zinc in the southeast end of the preliminary grid. This may indicate an increasing trend of silver-lead mineralization and should be further investigated by extending the grid to the south and east. The area should be further

prospected as well because a significant amount of quartz float was found in approximately the same area as the higher soil values.

Respectfully submitted,

Victor Ryback-Hardy
