F. A. INTRODUCTION

The claim area may be reached by a gravel surfaced road which runs between Stewart, -B.C. and the Granduc Mine. The property is at 1 1/2 mile on the Granduc road, approximately 25 kilometers from Stewart. (See Figure 1)

The property lies on the western flank and top of the Big Missouri ridge. Most of the property slopes between 30°-60° to the west. A thin layer of talus and overburden cover most of the property, except for the large scarps on the Big Missouri claim, outcrops are generally sparse.

The property consists of three reverted Crown Grants, the Winer (L3212), Big Missouri (L3217) and Packers Fraction (L5540), plus the Sarah 1 claim (12 units). The property is owned by Consolidated Silver Butte Mines Limited and is under option to Esso Resources Canada Limited as of August 20, 1980. (See Figure 2).

B. HISTORY

There has been no recorded production from the claims. A map by Buena Vista Mines Limited show limited trenching early in the 1930's on the claim block. In 1971, El Paso completed work which included a wide spaced geochemical survey over parts of the claim. In 1979, Consolidated Silver Butte Mines Limited contracted D. Cochrane to do a reconnaissance type induced polarization survey over part of the claim block.

The property includes the Big Missouri claim, but the Big Missouri Mine which produced from 1938 to 1942, lies on the Province claim (L3208). The main body of workings is 300 meters north of the Winer claim.

In the fall of 1980, Esso Resources Canada Limited completed a soil survey over portions of the Big Missouri, Packers Fraction and Winer claims, see McGuigan (1981).

C. WORK DONE IN 1981

1. Drill Site Preparation and Trail Construction

Drill site preparation involved leveling an area of ground large enough for the drill, water tank and rods. This was accomplished by drilling short blast holes, blasting, and leveling by hand. Trails were built from the drill site to the Granduc Road.

Costs of drill site preparation and trail construction have been previously reported as physical work and are not included in this report.

2. Drilling

Globe Drilling of 801-510 West Hastings St. Vancouver, was contracted to do the drilling using a Hydra - core 1 drill. Because of limited availability of drill sites, a hole was collared in a talus covered area at approximately L25, 2+50W. (See Map 8) The hole was drilled at -60 towards 260° (approximately 870 meter elevation) in B Q core to intersect mineralization of trench 2. (See Map 7)

Trench 2 is cut by a south dipping fault into a northern footwall and a southern hanging wall block (See Map 4). The fault has (30 cm) of gouge with unknown displacement. The northern footwall section exposes fine grained andesite flows, feldspar porphyritic andesite and andesite with secondary pyrite and quartz. The andesite with secondary pyrite and quartz strikes on an average to the north and dips at a high angle to the east. These rocks carried high gold, silver and base metal values. Average assay over the footwall section, based on 22 samples over a 23 meter width was:

Cu	Pb	Zn	Ag	Au
0.248%	0.40%	1.32%	1.76 oz/ton	0.176 oz/ton

The hanging wall portion of trench 2 exposes a volcanic breccia; fine grained andesite flows, with lesser sericite - silicified andesite and andesite with secondary pyrite and quartz. Assay values from this section were much lower.

At 34.5 meters the hole was still in overburden and had to be abandoned due to drilling delays and severe snow conditions. The core obtained from overburden is presently being stored at Esso Minerals Canada, Exploration Office, Stewart B.C.

D. SUMMARY AND CONCLUSIONS

1. Due to the steepness of the property, more time should be spent on drill site preparation closer to the target areas.
2. A larger drill should be contracted which would be better able to handle the overburden and faulted ground.

Bibliography

McGuigan, P.J. (1981), Geochemical Report on a Soil Survey over Portions of the Big Missouri, Winer, Packers Fraction Claims.

DEPTH (FEET) Meters	% Core Recy	LITHOLOGY	STRUCTURE	GEOLOGICAL DESCRIPTION	ALTERATION					FRACT INTENSITY
					A	B	C	D	E	
0				overburden (large rubble and blocks of rock probably due to slope failure and faulting)						
10				- overburden, consisted mainly of quartz - feldspar porphyritic andesite and quartz - sericite altered andesite; quartz stringers throughout; 1-2% disseminated pyrite, trace galena, sphalerite and chalcocite						
20	54%									
30										
				E.O.H. hole stopped in overburden.						

APPENDIX 2

Itemized Cost Statement

1)	Mobilization and demobilization of drill and crew (Vancouver - Stewart, B.C.)	\$ 3,000
2)	Drilling Footage Charges	\$ 8,112
3)	Drill Parts	\$ 2,944
4)	Room and Board, 10 days x 4 men	\$ 1,835
5)	Geologist, 10 days x \$85.00/day	<u>\$ 850</u>
	TOTAL	\$16,741

APPENDIX 3

Statement of Qualifications

I, Garnet L. Dawson, of Vancouver B.C., do hereby certify that:

- 1) I graduated with a Bachelor of Science Degree in Geology from the University of Manitoba in 1981.
- 2) I have been employed since that time as an exploration geologist in minerals by Esso Resources Canada Limited in British Columbia.

APPENDIX 4

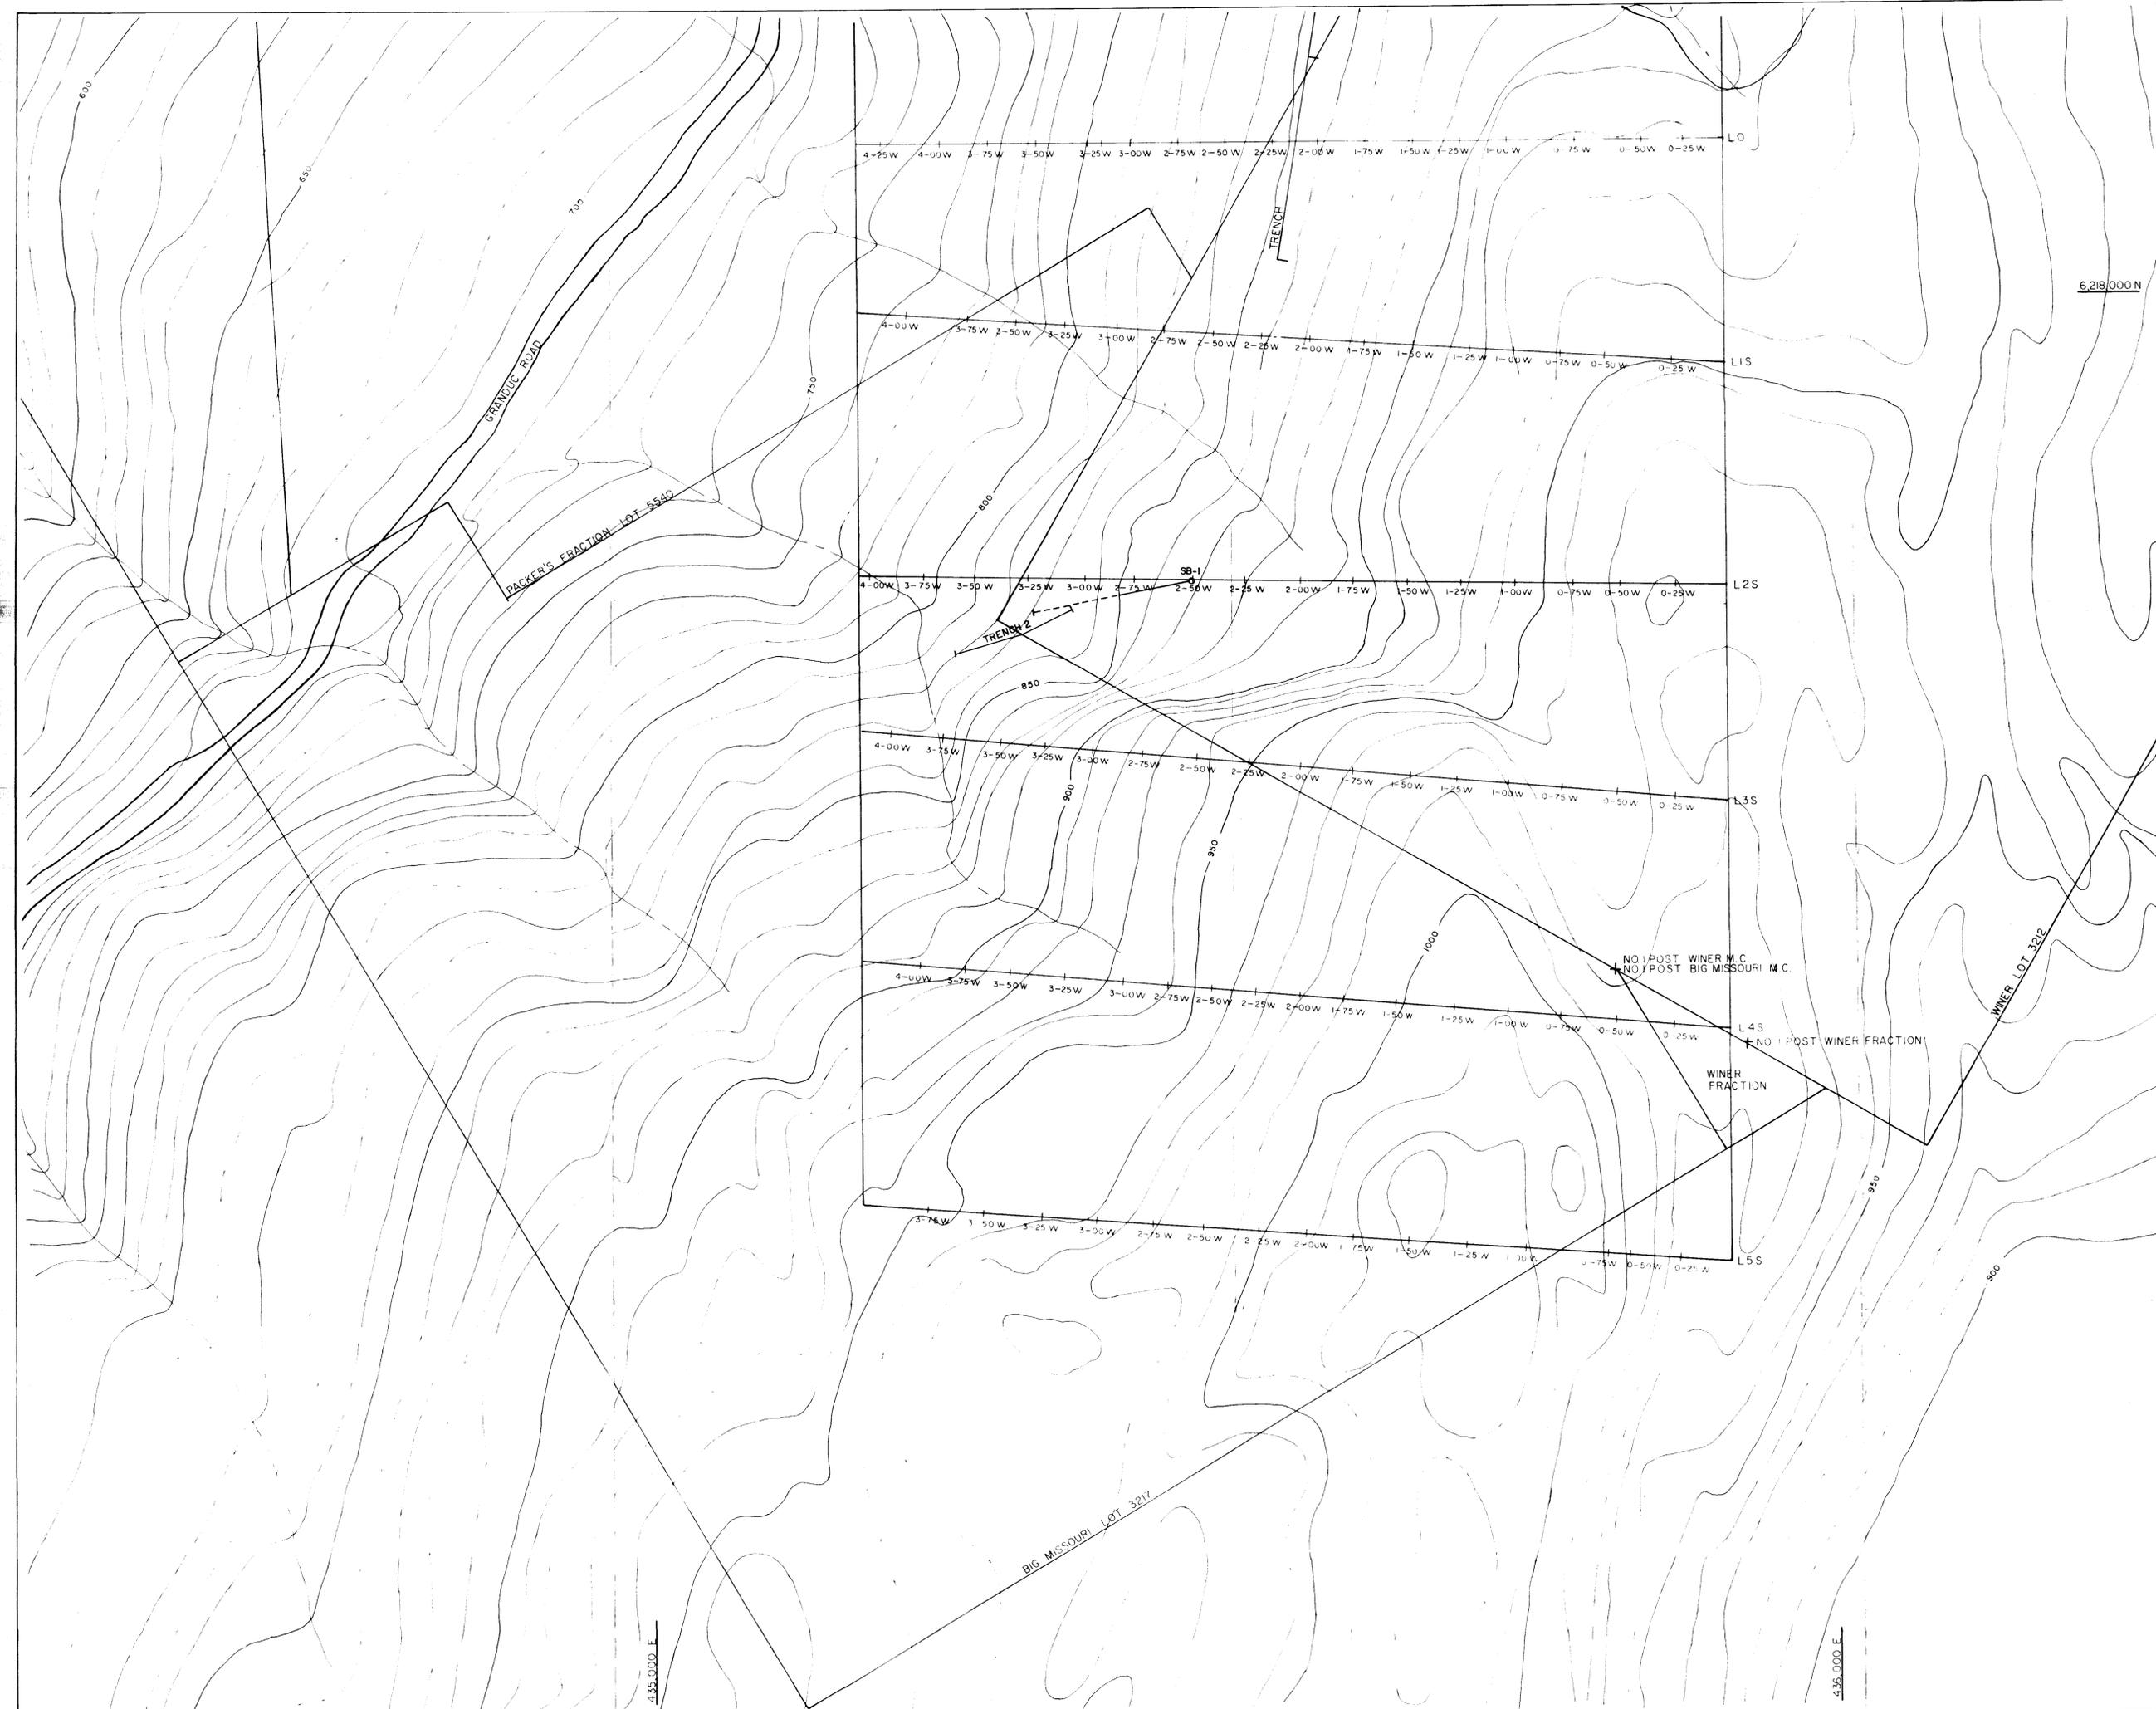

Statement of Qualifications

I, Paul J. McGuigan, of Stewart B.C., do hereby certify that:

- 1) I graduated from the University of British Columbia with a Bachelor of Science (Honours) Degree in 1974.
- 2) I have been employed since that time in minerals exploration, and since 1976 have been employed by Esso Resources Canada Limited.
- 3) The work done by Garnet Dawson as reported herein was directly supervised by me.
