INTRODUCTION

This assessment report was prepared pursuant to a request by Ware Resources Ltd., Suite 311, 543 Granville Street, Vancouver, British Columbia.

The purpose of this report is to review the results of detailed geochemical surveys done in the 1982 program of geochemical soil sampling over a selected area of the ARM-IDA claim group.

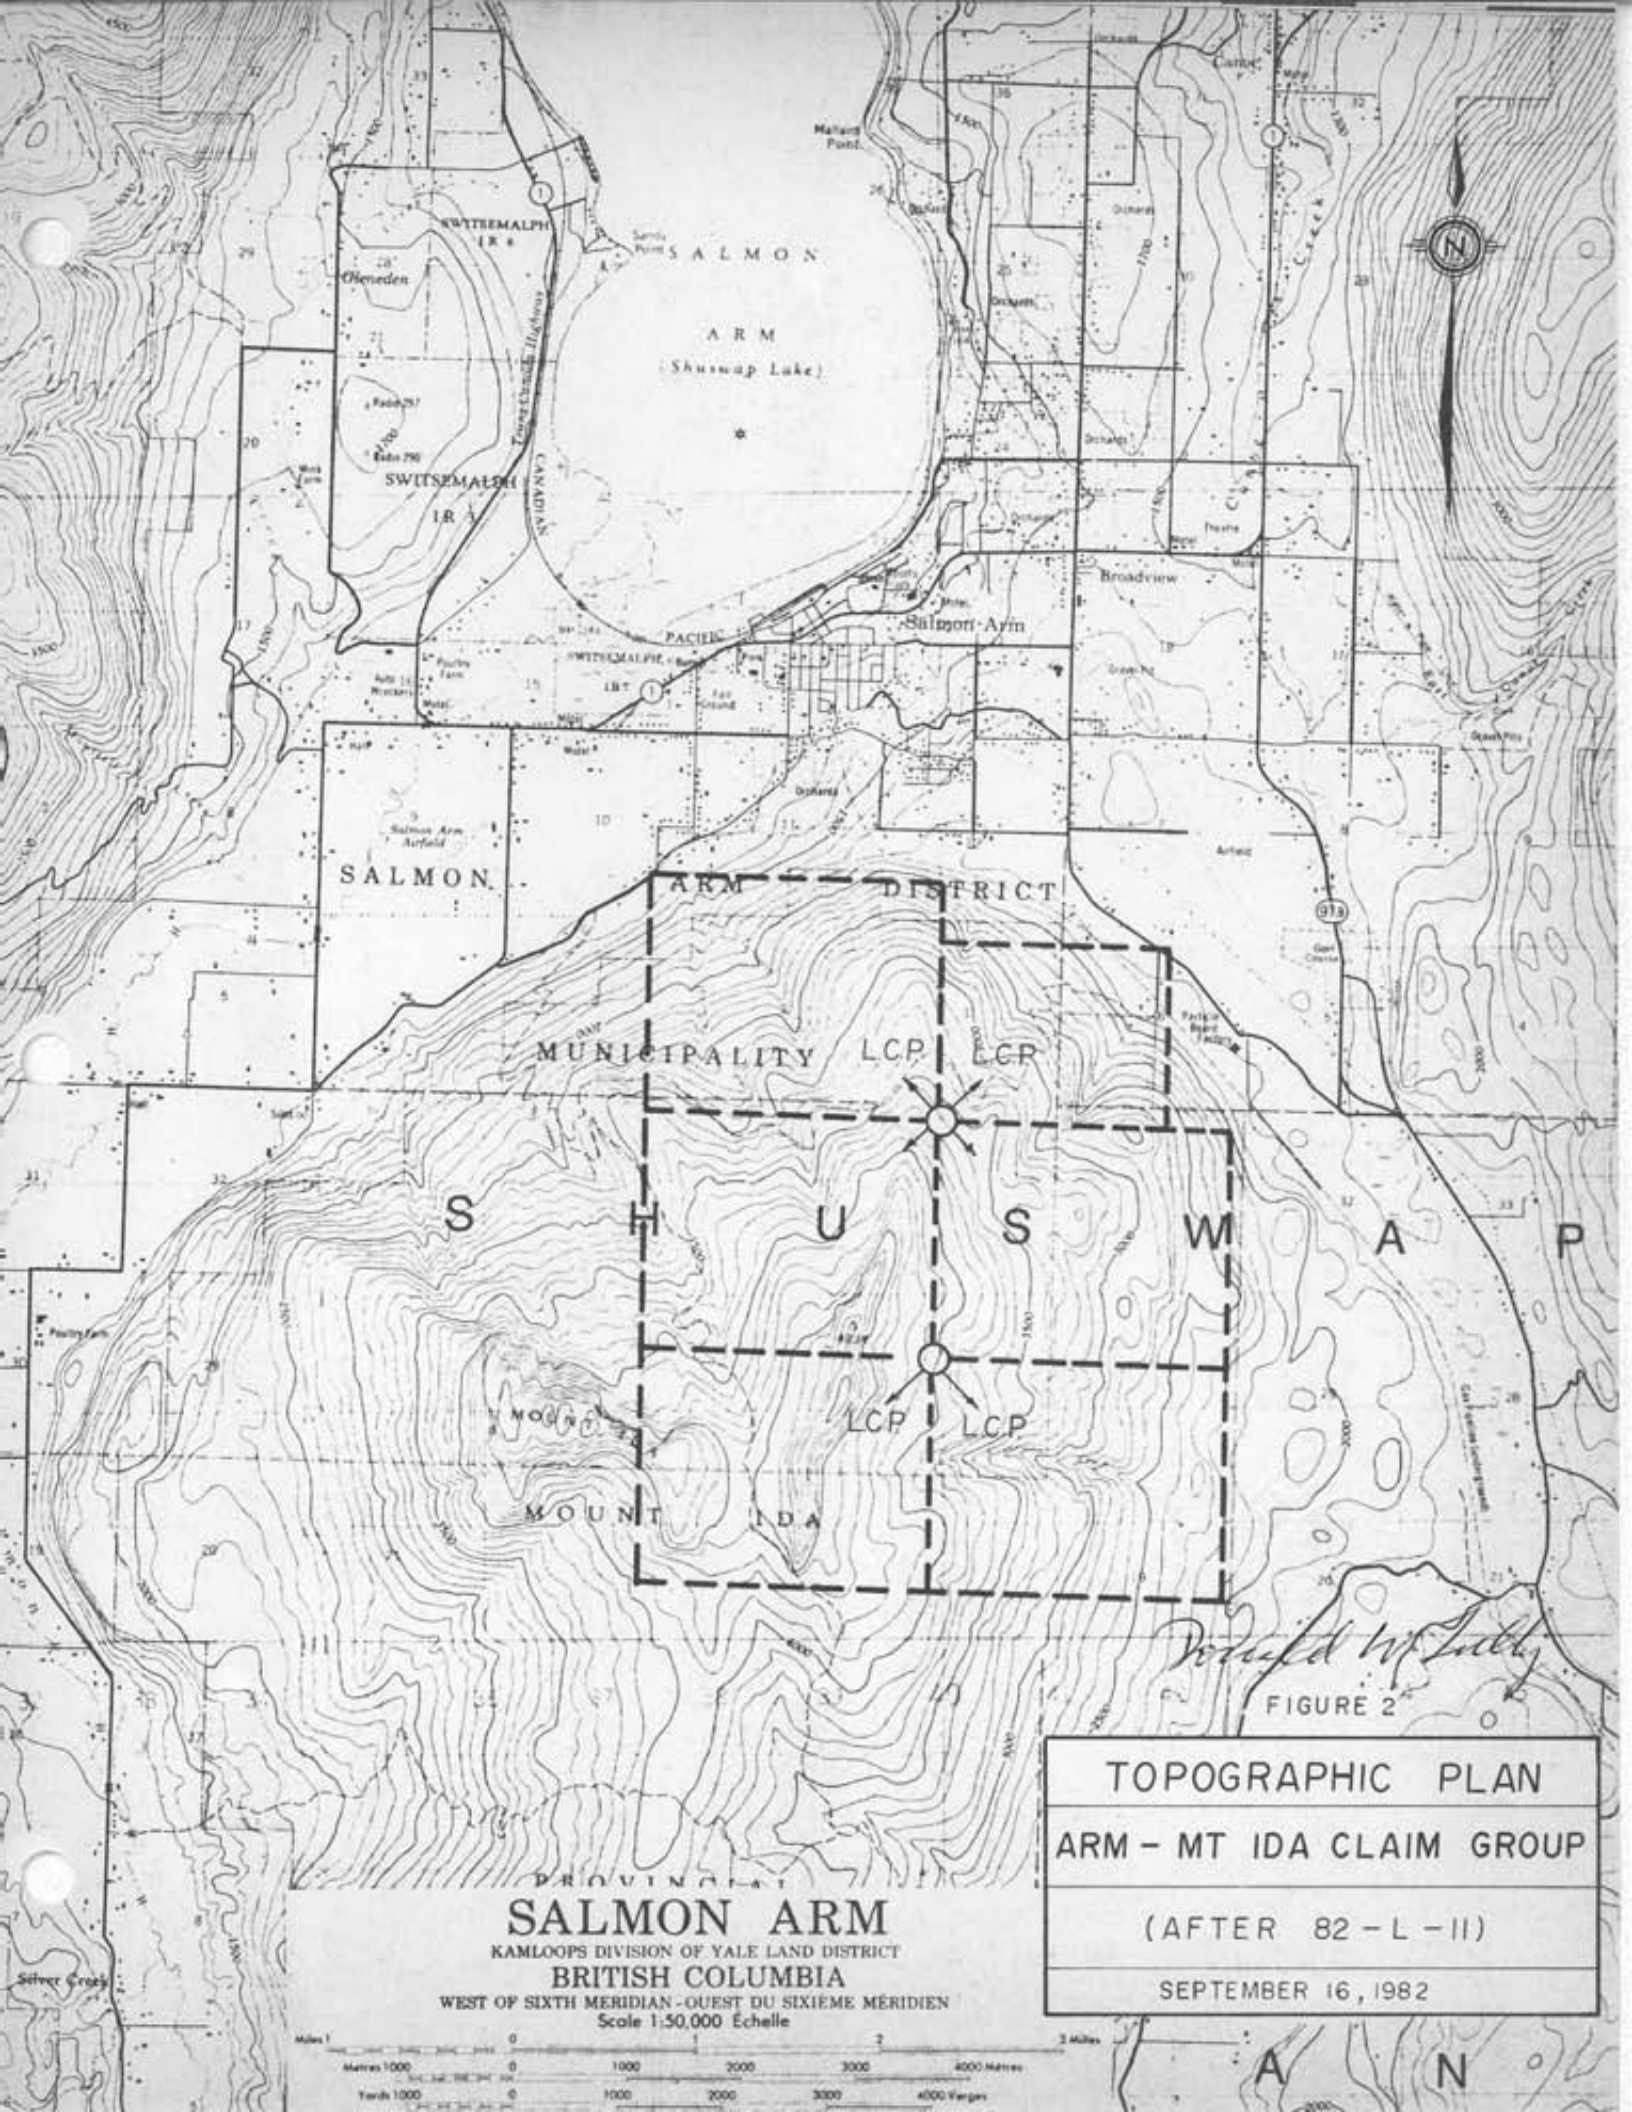

Until there is an improvement in the price of zinc, being the major metal indicated on this property, no further work is recommended.

SUMMARY AND CONCLUSIONS

The ARM-IDA property is a gold-silver and base-metal prospect. There are indications platinum may be present in the claim area.

The ARM-IDA claim group consists of six mineral claims comprising 112 units covering an area of 2,800 hectares located immediately south of the Town of Salmon Arm, British Columbia. Motor vehicle access is available over portions of the property using a four-wheel drive vehicle.

The history of the property dates back to the early 1900's when carrying high-grade silver values, boulders were discovered a short distance south of Salmon Arm. The Mount Ida group of mineral claims were later developed intermittently around the years 1905, 1913-14, 1926 and 1930. Since that time the property appears to have been idle, according to the record. Exploration work on the former claims consisted of underground crosscutting and drifting, mostly on the Everglade claim of the former

Mount Ida group. The location of the mineral showing is not clear but several gold-silver, galena and sphalerite occurrences in quartz-filled shear zones are indicated in the record. The precious metal, platinum, is of interest and is mentioned at three different claim locations, the Everglade, White Cliff and the Mountain View, by separate authors. However, ultrabasic rock is not mentioned in the literature covering the claim area.

A geochemical soil sampling survey was done over the claim area in July, 1980. The results of this work showed anomalous values for silver, lead and zinc in the northeast and east-central sectors of the property.

Detailed geochemical soil sample surveys were done over eight selected areas during the period November 17 through December 5, 1981 by Strato Geological. The results of this work showed anomalous zones of zinc in the north central area of the IDA 2 claim area.

During the period July 3 through 9, 1982, further detailed geochemical and sampling was done. The results also showed anomalous values for zinc.

PROPERTY - LOCATION, ACCESS, PHYSIOGRAPHY

The property is located in the Salmon Arm District Municipality about 500 metres south of the Town of Salmon Arm, Kamloops Division of the Yale Land District in the Kamloops Mining Division. Highway #1 traverses the northwest and northeast corners of the claim area (Figure 2).

The property comprises six mineral claims, namely the ARM #1 and #2, and the IDA #1 - #4 inclusive. The

six claims contain 112 units and the total area is 2,800 hectares.

The topography over the claim area is relatively steep and varies between 2,000 and 5,000 feet above sea-level. Trails occur over the northern and southern sectors of the property area and require four-wheel drive vehicle transport (Figure 2).

Most of the claim area is covered with forest.

CLAIMS

The ARM and IDA mineral claims are recorded in the Kamloops Mining Division. Information on file with the Gold Commissioner at Kamloops, British Columbia, is as follows:

<u>Claim Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Record Date</u>	<u>Recorded Holder</u>
ARM #1	20	2513	April 8, 1980	Ware Resources Ltd.
ARM #2	12	2514	April 8, 1980	Ware Resources Ltd.
IDA #1	20	2515	April 8, 1980	Ware Resources Ltd.
IDA #2	20	2516	April 8, 1980	Ware Resources Ltd.
IDA #3	20	2517	April 8, 1980	Ware Resources Ltd.
IDA #4	<u>20</u>	2518	April 8, 1980	Ware Resources Ltd.
	<u>112</u>			

Assessment work has been filed pending approval.

The ARM and IDA mineral claims are believed to be contiguous and are shown on British Columbia Mineral Claim Maps M82-L-11E and 11W. Portions of ARM #2 and IDA #2 are under mineral reserve to the Salmon Arm-Enderby Proposed Transmission line. The ARM #1 claim is in apparent contravention of a prior claim located astride Leonard

and Hobson Creeks in the northwest part of the claim area (Figure 3). A survey of the perimeter of the claim area is recommended to establish the property boundary and the respective relationship to any surface rights particularly along the north and east sectors of the claimed ground.

HISTORY - PREVIOUS DEVELOPMENT AND MINERALIZATION

In 1904, a Mr. F.A. McLeod staked the Mount Ida mineral claim over highgrade silver boulders found some four miles (7 km) south of Salmon Arm on the northwest slope of Mount Ida. This event is described in the Minister of Mines report for the year 1905. This find was indicated to have come from a vein located at right angles to a stream bed and was reported tested by several cross-cuts for a length of 38 feet. In 1913, the Mount Ida claim group was reported to consist of five mineral claims namely, the Everglade, Excelsior, Leah Rose, Alida and Eva. These claims were indicated to be located some 1,000 feet above Shuswap Lake and some five miles (8 km) south of the Town of Salmon Arm. It is the writer's opinion this description places the location of these claims in the area of the present IDA #4 mineral claim. The following is a resume of the development of the Mount IDA claim group at that time by W.M. Brewer:

" The rock formation in the immediate vicinity belongs to the rock classed by Dr. Dawson as the "Shuswap Series", made up of mica-schist, grey gneiss, crystalline limestone and quartzites. In this occurs a system of parallel ore-bodies, from 18 inches to

" 7 feet wide, composed of galena in a quartz gangue; these appear sometimes to be contact deposits between the micaceous schist and quartzite, and at other places between the schist and marble. The strike of these generally is approximately north-east, and dip from an angle of 65 degrees to almost vertical towards the south-east.

All the development-work has been performed on the Everglade mineral claim, and consists of 346 feet of underground work, as follows: Upper adit 130 feet long, at an elevation of about 1,000 feet above the lake; this crosscuts the mica-schist formation for about 100 feet, then a seam of quartz between 6 and 7 feet wide carrying quite an appreciable percentage of galena, then limestone forming the footwall. From this point a drift has been run, but, owing to caving of the roof from slacking, this could not be closely examined; however, I was able to take a sample from the face typical of the ore-body, but not intended to represent an average of the entire ore-body as it would be mined. This sample assays: Gold, trace; Silver, 7 oz per ton.

A lower adit has been driven 230 feet with the intention of driving under the upper adit, at a vertical depth below it of about 260 feet, but has not yet been driven sufficiently far to reach the point aimed at. Near the face of this adit the water that percolates through the strata and cleavage-planes of the country-rock is blood-red, evidently from iron stains, and there is also a considerable quantity of iron-pyrites disseminated through portions of the rock,

" apparently indicating that a mineralized zone might be looked for as the work progressed. At the portal of this adit a body of quartz carrying some galena was exposed, but this had the appearance of having been broken off and having slipped from a higher elevation.

An ore-body outcrops at a point about 50 feet vertically above the upper adit, where a shaft was sunk 16 feet deep, in which is exposed a quartz vein, 18 inches wide, carrying galena; it is apparently wider on the north-east side of the shaft than on the south-west side. It is doubtful whether this is the same orebody as is exposed in the upper adit, although it may be.

Two other outcroppings of the same character of ore occur, one at about 100 feet lower elevation than the shaft referred to, and another about 60 feet still lower down the mountain, but a short distance north of a direct line between the two last mentioned. On the first of these a shallow open-cut has been made while on the last named there is an open-cut and shaft; this has been sunk about 15 feet deep below the bottom of the cut, in which is exposed an ore-body about 3 feet wide of quartz carrying galena. "

Mr. W.F. Ferrier, reporting for the Munitions Resources Commission, Canada, in the final report dated 1920, indicated the presence of platinum at Mt. Ida. Mr. Ferrier reported the first claim sampled was the White Cliff claim on the northeast slope of Mt. Ida at an

elevation of about 3,150 feet. This elevation does not agree with that of Mr. W.M. Brewer in his report of 1913 but the description of the workings is somewhat similar. Ferrier obtained two samples, from what he has indicated may be the Everglade claim, that assayed as follows:

<u>Sample No.</u>	<u>Claim</u>	<u>Description</u>	<u>Gold Oz/Ton</u>	<u>Pt Oz/Ton</u>
5	Everglade (?)	Miller Tunnel width 4.75 ft. Across face	0.24	0.02
6	Everglade (?)	Miller Tunnel Mineral streak in face 1½ in- ches wide	0.14	0.03

O'Neill and Gunning, in a report contained in the Geological Survey of Canada Economic Series No. 13 on page 103, referred to the investigations by Mr. Ferrier and also reported that samples taken from the Mountain View Claim across widths of 8.5 feet and 2.5 feet, respectively, assayed 0.20 and 0.02 ounces of platinum. Sheared zones carrying quartz stringers with attendant sphalerite, galena, chalcopyrite and pyrite were also noted and the sample results from the shears were said to carry small amounts of platinum and interesting amounts of gold.

In 1926, the Bonnie Brae group of four claims were reported on by the Minister of Mines for that year. This group was said to be located on the north slope of Mount Ida about 1,500 feet above the valley of the Salmon River (1,200 feet) apparently in the area of Hobson Creek near the common boundary of ARM #1 and IDA #1 mineral

claims. The description given is as follows:

" The mineral occurrences on this group are represented by extensive bodies of quartz, containing pyrite and some blende and galena carrying silver values and a little gold. This quartz occurs in zones of shearing and fracturing in impure quartzites and schists, traversed by dykes of feldspar porphyry. A number of open-cuts strung out in a general direction of N 60° E (mag.) exposes a series of these quartz-bodies varying up to 6 feet in width, which appear to lie within a dominant zone of fracturing. The most north-easterly of these open-cut exposures lies at a vertical distance of about 250 feet above the bed of Hobs creek (locally known as Hobson creek), which follows an oblique course down the slope of the mountain in a northwesterly direction. From a point on the steep bank of this creek, lying almost due north from the outcrop above mentioned, a tunnel has been driven for a distance of about 70 feet in a general southerly direction, following the course of a porphyry dyke which lies on the western side of a zone of shearing, having a dip of about 50° to the north-east. The ground in the neighbourhood of the dyke is much disturbed and the width of the zone cannot be stated definitely; a characteristic feature is the inclusion of bodies of quartz, one of which is also exposed in the bed of the creek about 50 feet farther to the east, indicating a width of about 50 feet farther to the east, indicating a width of about 50 or 60 feet for the zone. The new work above referred to was done on the Foothill in a canyon of the same creek at a distance of approximately three-quarters of a mile to the north-west of

" the upper workings of the Bonnie Brae group and about 1,200 feet below them. A zone of shearing in the same schist and quartzite formation is exposed in open-cut workings at a sharp bend of the creek. This zone has a north-westerly strike and a dip of about 50° to the north-east, and the inclusion of quartz associated with a considerable amount of pyrite is in all respects similar to that found in the upper workings. It is indicated that the two sets of workings are on the same zone of shearing, which is in all probability responsible for the direction taken by the creek in its oblique course across the hillside occupied by a hard quartzite formation.

In these lower workings there is also a considerable amount of massive pyrrhotite on the footwall side of the zone, and this is not without significance, occurring as it does at the lowest point at which this apparently persistent shear has been exposed. The upper line of outcrops above referred to, following a north-easterly direction, appear to occupy fractures in a greatly disturbed section of the formation intersected by the porphyry dykes, and all these occurrences are to be referred probably to a main source of mineralization along the shear zone. The whole base of Mount Ida is underlain by granite, and it is in this connection that the occurrence of heavy sulphide mineralization in the lower workings is held to afford some encouragement for further development along the line of shearing in the overlying quartzite. The following samples were taken:

" A picked sample of quartz from the face of the 70-foot tunnel: Gold, trace; silver, 12 oz to the ton. Quartz from Foothill: Gold, trace; silver; trace. Quartz on hanging-wall of shear in 70-foot tunnel: Gold, trace; silver, 0.6 oz to the ton. Quartz from upper open-cuts in crossfractures: Gold, trace; silver, 6 oz to the ton. Pyrrhotite from Foothill: Gold, trace; silver, trace; zinc, trace.

Sunset:

This group of eight claims is situated on Mount Ida, near Salmon Arm. Two main veins occur on the property; the lower vein was developed to some extent several years ago and carried values in silver and lead. The upper vein has been reported to carry values in gold and platinum, but no further information is available in regard to this occurrence than was furnished in the account given by W.F. Ferrier and published in the Final Report of the Munition Resources Commission in the year 1920.

The property is now owned by Sunset Mines, Limited, with head office in Salmon Arm, and it is understood that further work is to be commenced during the coming year. "

A geochemical soil sampling survey was carried out over the ARM 1, 2 and IDA 1, 2, 3, 4 claim area in July 1980. An underground tunnel was re-opened in August-September, 1980.

In November, 1981 a program of detailed geochemical soil sampling was carried out over eight selected areas on the IDA 2 and 4 claim areas.

In July 1982, a further program of detailed geochemical soil sampling was also carried out.

REGIONAL AND LOCAL GEOLOGICAL SETTING

According to Geological Survey of Canada Map 1059A (Vernon Area) the claim group is underlain by five distinct lithological units, which are the Silver Creek, Mara and Sicamous formations intruded by the Coast Intrusions of acidic rocks and overlain by the Kamloops Group of Tertiary basaltic lavas.

A tentative geologic timetable is as follows:

<u>Formation</u>	<u>Description/Event</u>	<u>Age</u>
Sand, gravel, loam deposits	Unconsolidated (Erosional unconformity)	Quaternary
Mineralization and attendant quartz veining	Silver, gold, (platinum ?) and associated sulphides of lead, zinc and iron (Tectonic activity)	(Tertiary ?)
Kamloops Group of volcanics	Basaltic lavas (Tectonic activity)	(Miocene ?)
Coast Intrusions	Granite, granodiorite (Erosional unconformity and tectonic activity over several eons of time)	Jura-Cretaceous
Sicamous Formation (Shuswap Terrane)	Limestone and several schist facies	(Proterozoic ?)
Mara Formation	Calcareous and pelitic sediments and schist facies	(Proterozoic ?)
Silver Creek Formation	Quartz-sericite-biotite schist facies with calcareous horizons	(Proterozoic ?)

Structurally, the lineal elements of fracturing and schistosity trend both northeast and northwest. The northeast schistosity trend appears dominant in the earlier underlying schist facies of the Shuswap Terrane Complex while the northwest trend of fracturing is evident in the later lithological units (Figure 4).

Two north-northwest striking fault zones are shown traversing the claim area suggesting a fault contact

Donald W. Tully

between the Silver Creek, Mara and Sicamous formational units. A major through-going fault zone trends north-westerly along the area of Hwy 97B between Salmon Arm and Enderby just east of the claim area.

A sizeable aeromagnetic "Low" occurs in the area of IDA #3 claim and a study of Geological Survey of Canada Aeromagnetic Map 8514G suggests both northeast and north-west bedrock structural trends are reflected over the claim area.

The trend of the mineralization from the geochemical soil sample results appears to be generally north-south.

RESULTS OF THE 1982 GEOCHEMICAL SOIL SURVEY PROGRAM

The period of the field survey was July 3 through July 9, 1982, inclusive. The field work was carried out by S. Young and J. Forster, Suite 311, 543 Granville Street, Vancouver, B.C.

Detailed geochemical soil sampling was carried out along 10.3 kilometres of line as shown on Figures, 4, 5, 6 and 7.

East-west control lines were established 125 metres apart over the sampled area. Geochemical soil samples were taken at each 25-metre interval along the control lines. The writer has not examined the work in the field.

Anomalous zones of zinc, lead and silver were found.

A total of 449 soil samples was taken and analyzed for silver, lead and zinc. The assays are plotted on Figures 5, 6 and 7.

The results of the analyses are as follows:

<u>Zinc (Figure 5)</u>	<u>No. of Samples</u>	<u>Range of Results</u>
	179	0 - 100 ppm
	112	101 - 200 ppm
	65	201 - 300 ppm
	50	301 - 400 ppm
	27	401 - 500 ppm
	5	501 - 500 ppm
	11	601+ ppm
	<u>449</u>	

The highest value found in zinc was 1,050 ppm.

Values in zinc above 400 parts per million are considered to be anomalous.

Several strong zones of values in zinc occur in the area of lines 1,000N through 1,500N in the north sector of the property (Figure 7). Values in lead and silver tend to accompany the values in zinc.

The trend appears to be generally north to north-westerly. This trend in relation to the trend of values in silver and lead suggests the possibility of a later age for the zinc mineralization along a subsequent fracture pattern.

<u>Lead (Figure 6)</u>	<u>No. of Samples</u>	<u>Range of Results</u>
	132	0 - 0 ppm
	244	11 - 20 ppm
	53	21 - 30 ppm
	9	31 - 40 ppm
	7	41 - 50 ppm
	4	51+ ppm
	<u>449</u>	

The highest value in lead was found to be 105 parts per million on line 1,125N at 1,025E.

Values in lead above 40 ppm are considered to be anomalous.

Anomalous values in lead tend to accompany values in silver on line 1,000N in the area of line 850E and line 1,125N in the area of 1,000E.

The trend of the lead values is northeasterly.

<u>Silver (Figure 7)</u>	<u>No. of Samples</u>	<u>Range of Results</u>
	327	0.0 - 0.5 ppm
	66	0.6 - 1.0 ppm
	39	1.1 - 2.0 ppm
	12	2.1 - 3.0 ppm
	5	3.1+ ppm
	<u>449</u>	

The highest value in silver was 10.3 parts per million.

Values in silver above 1.0 ppm are considered to be anomalous.

Anomalous values in silver tend to accompany the values in zinc. The trend of anomalous silver results is northeasterly.

RECOMMENDATIONS

Until the climate of metal prices for zinc improve, it is proposed no further work be done on this property.

Respectfully submitted,

Donald W. Tully, P. Eng.

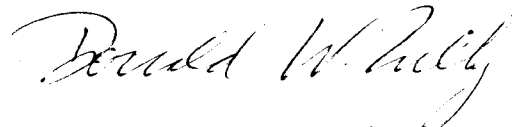

September 16, 1982

CERTIFICATE

I, DONALD WILLIAM TULLY, of the City of West Vancouver, Province of British Columbia, hereby certify as follows:

- 1) I am a Consulting Geologist with an office at Suite 102, 2222 Bellevue Avenue, West Vancouver, B.C.
- 2) I am a registered Professional Engineer of the Provinces of British Columbia and Ontario.
- 3) I graduated with a degree of Bachelor of Science, Honours Geology, from McGill University in 1943.
- 4) I have practiced my profession for thirty-seven years.
- 5) I have no direct, indirect or contingent interest in the securities of Ware Resources Ltd. or the ARM 1, 2 - IDA 1, 2, 3, 4 mineral claim group, subject of this report, nor do I intend to have any interest.
- 6) This report dated September 16, 1982, is based on personal field examinations I made on July 28, 1980 and from information gathered from available maps, reports and personal communications. I have not examined the 1982 program of geochemical soil sampling in the field.
- 7) I have not consulted on any claims within ten kilometres of the ARM and IDA claim group during the past five years.
- 8) Written permission is required from the author to publish this report dated September 16, 1982 in any Prospectus or Statement of Material Facts.

DATED at West Vancouver, Province of British Columbia, this 23rd day of September, 1982.
