## SUMMARY

---

A programme of preliminary geological, geochemical and geophysical surveys was carried out on the property of Petroquin Resources Ltd. The property is located approximately 45 kilometres north-northwest of Greenwood ,B.C.

The claim group was mapped at scale of 1:5000, the area mapped totalled  $4.34\text{km}^2$  . Magnetometer and soil sampling surveys were carried out on the property, the results of these surveys show that anomalies area occurs within lines 300W-850W and 750S,400W-550N.

Ground control was established with flag lines, established from a 2.5 km north  $43^\circ$  east base line. Lines were at 200 metres Intervals.

Geology consists essentially of a quartz diorite stock emplaced into a series of volcanic rocks. Post mineralization dykes of many variaties intrude the quartz diorite and volcanic rocks.

The trend of the volcanic is poorly defined, but appears to be north-northwest.

The volcanic rocks are variably altered. Sulphide mineralization is widespread on the property, but is mainly associated with light green , fine grained cherty volcanic rocks.

## 1. GENERAL

---

### 1.1 Location

---

The Kettle # 3 property is located about 45 kilometres northwest of Greenwood, B.C. The claim area is located on the west side of the kettle river ,northeast of Beaverdell ,B.C.(Fig.1).

### 1.2 Access

---

Access to the property is from Westbridge,B.C. by a gravel road which leaves the main kettle river road about 34 kilometres north of Westbridge,or by gravel road from Beaverdell ,northeast of Beaverdell creek road about 11.3 kilometres and than 17.6 kilometres on a logging road. Both roads transect the middle of the claim area. Access elsewhere on the property is on foot.

### 1.3 Topographic

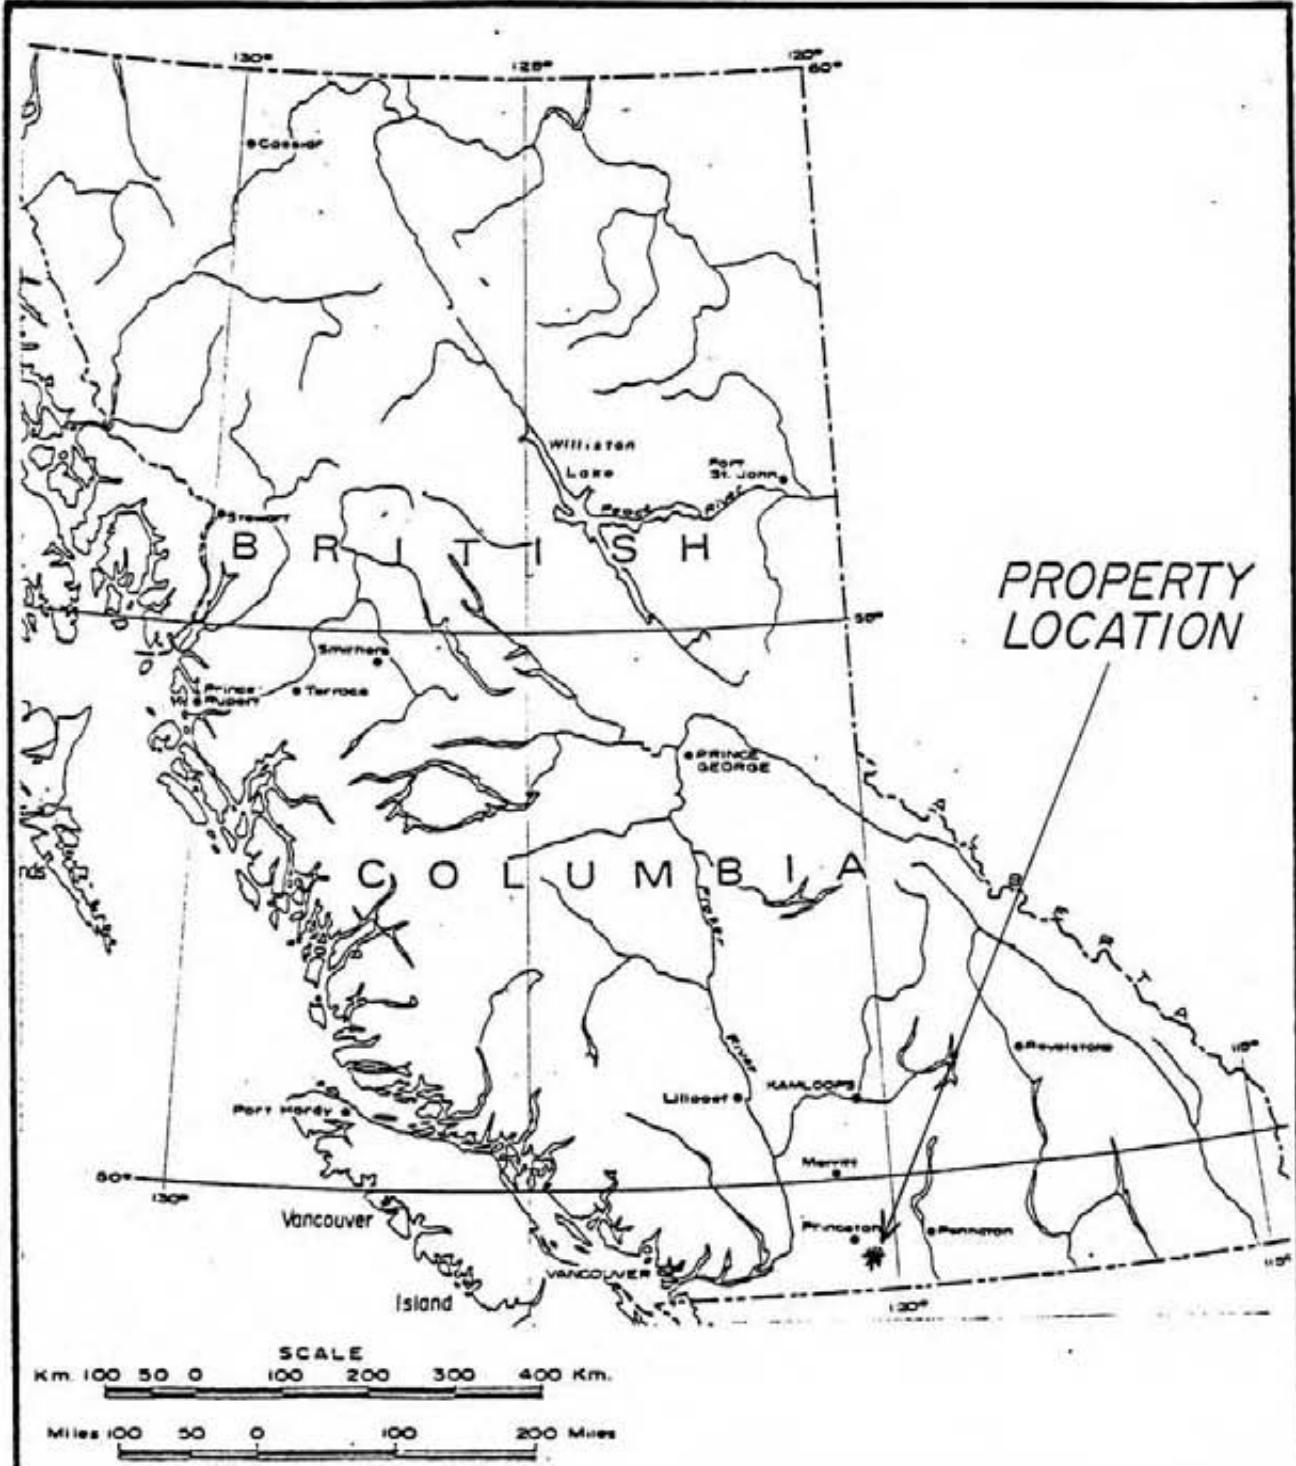

---

The topography of the claim area is moderately steep. Elevation range from 1,067 metres to 1220 metres. Dense timber and other trees cover the claim area. Outcrop pattern is sporadic and mainly occurs in the middle and the boundary of the property. (Fig.2)

### 1.4 Claim Status

---

The Petroquin Resources ltd. property is held through its agent Mr. Melvin Yen,2104 West 57 Avenue ,Vancouver,B.C. by an option agreement dated February 22,1983 between Messrs.George A.Bleiler, John E.Millette,Donald A.Mcleod,James W.Macleod-the optionors, and Mr Melvin Yen-the optionee.

Wilson A. Gewargis, B.Sc., F.G.A.C.

June 83

The property (Fig.3) consists of the following claims in the Greenwood Mining Division .

Located Mineral Claims:

Claim	Record No.	Expiry Date
Kettle # 3	1971(10)	October 21,1986
Go 1	2729(6)	June 8,1986
Go 2	2730(6)	June 11,1986

Reverted Crown Grants:

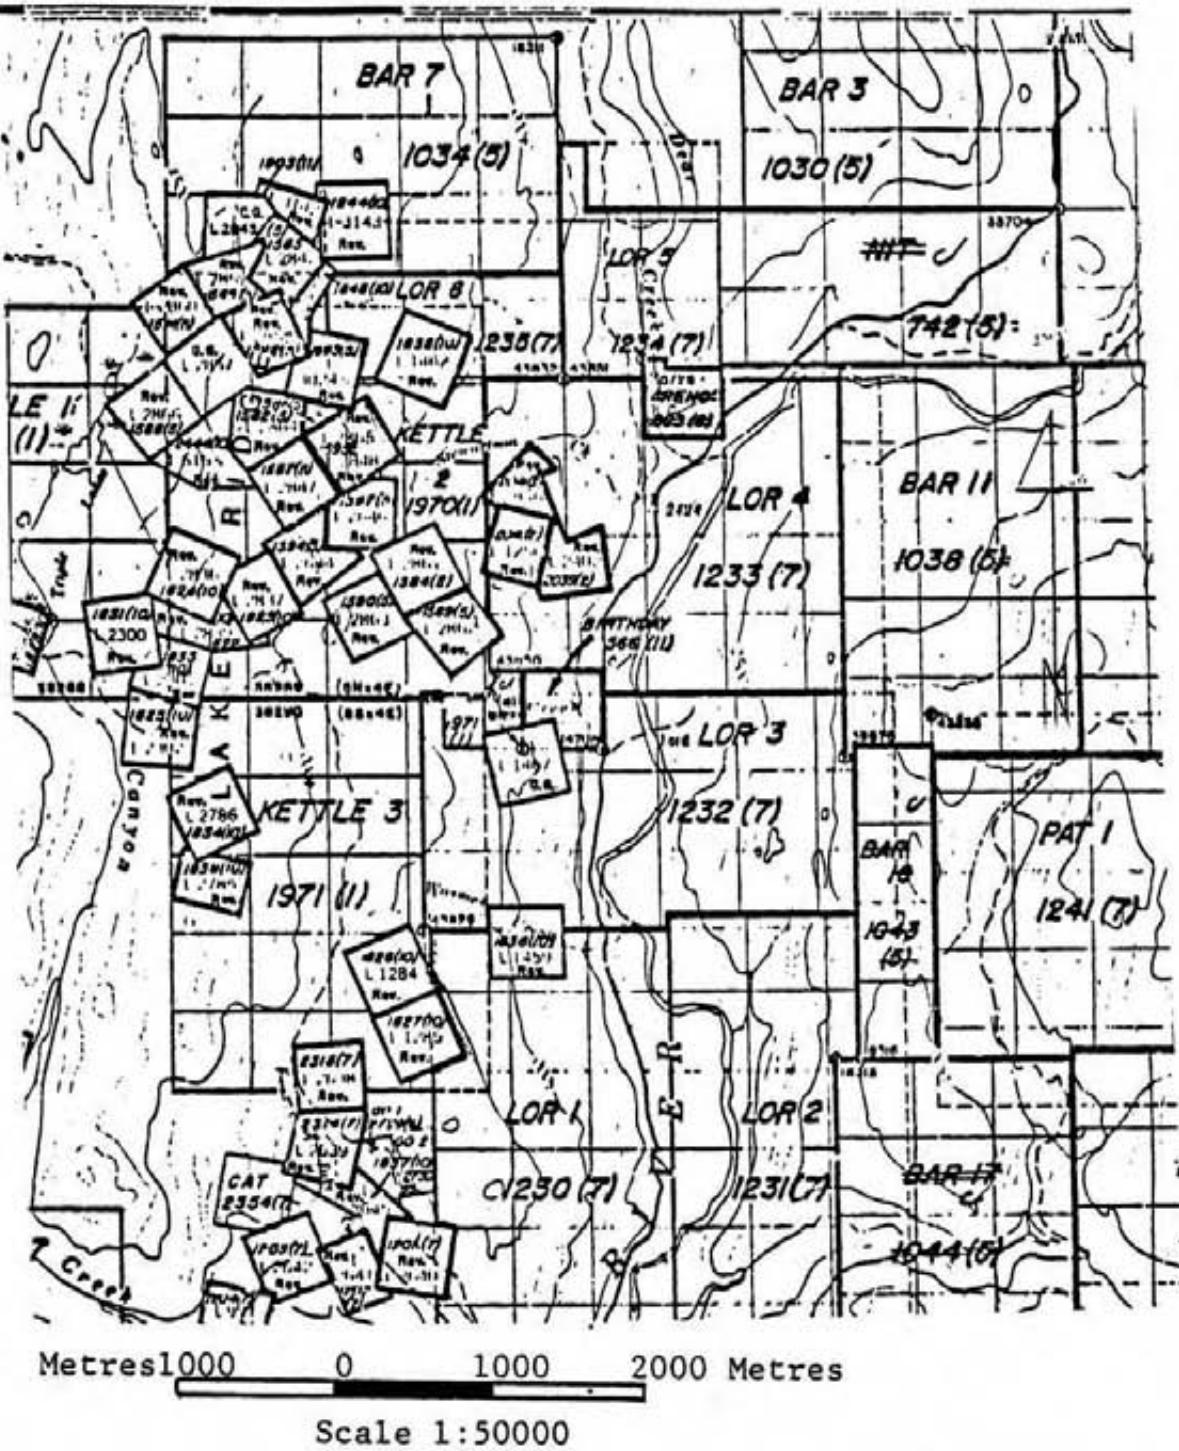

Claim	Lot No.	Record No.	Expiry Date
7:30	1459	1836(10)	October 22,1986
Superior	2786	1834(10)	October 22,1986
Jewel	2785	1838(10)	October 22,1986
Lillie May	1285	1827(10)	October 22,1986
Mayflower	1284	1826(10)	October 22,1986

1.5 Previous Work

The area north of the kettle #3 claim has been the focus of prospecting activities since mid 1890'S . The gold mineralization in the area north of the claim group was discovered in 1896.

Numerous claims were Crown granted,including the Reverted Crown Grants of the Petroquin Resources Ltd. Mining and exploration activities subsided after 1901, although claims owners continued to crown grant their claims through 1905.

In september 1980 Western Aero Data Ltd. under the direction of

PETROQUIN RESOURCES LTD.

## DISCUSSION

Wilson A. Gewargis, B.Sc., F.G.A.C.

June 83

Glen White P.Eng. conducted an airborne VLF-EM and magnetometer survey over Kettle # 3 and adjoining claims for Carmac Resources and Suneva Resources ltd. In may 1981 Carmac Resources Ltd. under the direction of the writer ,conducted a varied programme of trenching,sampling, geological mapping,geochemical and geophysical surveys.

In late 1981 diamond drilling programme was carried out on the property north of the Kettle # 3.

## 11 REGIONAL GEOLOGY

---

The regional geology of the area has been described by Reinecke (1910,1915) and G.S.C. (Little,H.W. 1953-1956 ,Map 6-1957) and shows the area to be underlain by mainly permian part of Anarchist group, the oldest unit known in the area. It consists of the metamorphosed andesitic tuff and lavas ,hornfels,rhyolite and locally sedimentary rocks. Series of intrusive porphyritic dykes of Tertiary Kettle River formation ranging in composition from quartz porphyry to hornblende andesite porphyry, occur throughout the area. These dykes are believed to be post mineralization and intrude the quartz diorite and volcanic rocks. The trend of the volcanic rocks is poorly defined but appears to be north-northwest. The area has been folded and the kettle river northward from Rock Creek which occurred to the west of the property 1.1 km,contains shear zones that were initiated after the intrusion of the Nelson Batholith.

## 111 GEOLOGY

---

### 3.1 General

---

The general geology of the Kettle # 3 property consists of north

quartz diorite stock emplaced into variably altered units of Anarchist assemblage (Fig.4). The Anarchist assemblage comprises a predominance of fine to massive groundmass of andesitic affinity. A prominent unit on the is an altered cherty sequence of Anarchist unit (1c) that gives rise to quartz -pyrite/pyrrhotite assemblage, exposed in the lines 300W-850W and 750S ,400W-550N . Lying around this unit, are somewhat massive ,dark green andesitic volcanic unit (1a,1b). The Westkettle quartz diorite, is exposed on north-northwest of the property and is locally shered.

A series of intrusive porphyritic dykes (3a,3b) of the Tertiary Kettle River formation occurs through out the property. These dykes are believed to be post mineralization and intrude the quartz diorite and volcanic rocks.

Dark black porphyritic dyke occurs on the line 1200W-1500S. The dominant area of mineralization pyrite/pyrrhotite is in the area of lines 300W-850W and 750S within the volcanic unit(1c). The sulphides mineralization occurs within the above unit.

### 3.2 UNIT 1 The Volcanic Assemblage (1a,1b,1c).

---

The Anarchist assemblage in the Kettle#3 area is predominately a fine to massive grained andesite. The dark green massive andesite(1a) , is not sufficiently clear to establish bedding or facing direction by itself.

This unit occurs around the boundary of the property. The andesitic volcanic with quartz-orthoclase phenocryst (1b) , is similar to unit (1a) in composition and was recognized along the eastern portion of the base line, lines 200E-600E and to the south.

The finer grained cherty unit member (1c) of the Anarchist assemblage is present in the centre of the property and may found in other parts, but is problematic in aspect. In part this is due to weathering characteristics of the outcrops. Bedding was noted at 1400W-436N, a strike of  $345^{\circ}$ , dipping westly with beds facing west. The Anarchist assemblage on the property was laid down in quiet waters either in large lake or arm of sea . These units were probably extruded in the Triassic through volcanoes of the explosive type and than blown out as fine ashes . They were followed by quiet flows of augite andesite lavas.

### 3.3 UNIT 2 Westkettle Stock

---

The Westkettle stock generally comprises of a quartz diorite or granodiorite ,the unit is generally uniform in texture and only locally more porphyritic . Compositional variation is subtle and indistinct.

Within the area mapped ,there is no clear evidence of composite intrusion. The border phase of intrusion is manifested by a fine grained aspect,that this is relatively uncommon.

### 3.4 UNIT 3 Dyke Rock(3a,3b)

---

A diverse assemblage of dyke rocks are exposed on the Kettle #3 property,ranging in composition from pyroxenite,hornblendite ,quartz and olivine grabbo.

#### Unit(3a) microdiorite (prophyritic)

---

The above unit of distinctive characteristics is found all over property within the volcanic assemblage and the stock. The unit is medium to coarse grained,dark green porphyry with 10% orthoclase

phenocryst and 15% fine green mafic grained. The phenocysts range between few mm to  $\frac{1}{2}$  cm in size . It is generally fresh and not significantly deformed or altered. This dyke is narrow ,up 2 metres wide.

Unit(3b) porphyritic (gabbro)

---

The above unit ,is only found in the area of 1000W-1270S, 1000W-1350S and line 1047W-1500S. This unit is very thick and is medium grained,dark black with fine 5% porphyritic phenocrysts.

3.5 MINERALIZATION

---

For the purposes of description,the mineralization in the property are categorized into the following pattern.

- a) disseminated pyrite/pyrrhotite in an altered volcanic host.
  - b) quartz veins with pyrite/pyrrhotite
- 
- a) disseminated pyrite/pyrrhotite in an altered volcanic host.

The above unit is widespread on the property. It is exposed in the area between lines 300W-850W and 750S,400W-550N. The possibility exists that the mineralization has general relation to the cherty unit of the volcanic rocks unit(lc) and thus may occur as an irregular horizon . Also the mineralization occur with the volcanic unit(la,lb) .

Several samples were taken from various locations on the property and sent for assaying for gold,silver,copper. There appears to be an economic potential to this unit.

b) quartz veins with pyrite/pyrrhotite

---

The quartz vein was found in two locations on the property in an old trench at 1200W-516N, the vein occurs within the volcanic unit associated with disseminated pyrite/pyrrhotite, about 0.3 metre wide and irregular, striking 170° and dipping vertically. Quartz vein is also found in the area of 1800W-15N, within the cherty volcanic unit. The above quartz veins are not widespread, however and are of limited strike, length and width.

4 GEOCHEMICAL SURVEY

---

4.1 Introduction

---

Soil sampling was carried out on the north 43° east grid established in June 1983. This grid trend northeast base line and the lines are 200 metres apart and start from 0+00 -1850W on the westerly end and finish at 0+00 -600E on the easterly end of the grid. From the profiles done in the field, samples were taken from B horizon. Total of 426 samples were taken and analyses by BLOOM TEST in the field for the THM(Pb,Zn,Cu,), this test measures the cumulative concentration of readily extractable heavy metals in soil samples. The results were plotted on 1:5000 scale topographic map and then contoured for any results higher than 1.

#### 4.2 Method

---

##### INSTRUCTIONS - THM TEST (Total Heavy Metals)

---

1. Add 100 ml benzene to a beaker containing 1 dithizone filter paper. Allow dithizone to dissolve. Stir and remove paper with glass stirring rod. Make fresh batch whenever analysis is run.
  2. Fill dithizone solution in a squeeze bottle.
  3. Use THM buffers directly. Fill buffer into the squeeze bottle.
  4. Take a level scoopful of dry, sieved sample (.25 gram size) or fine segment of sample if test done in the field. Keep hands away from sample to avoid contamination. Add to a test-tube.
  5. Add 5 ml of buffer solution from the squeeze bottle.
  6. Add 2 ml of dithizone solution from the squeeze bottle.
  7. Stopper tube and shake vigorously for 20 seconds.
  8. Observe colour of dithizone layer when separated. If blue-green, test is completed. Record sample weight and volume of dithizone used.
  9. Should colour be purple or pink, add further increments of dithizone solution, mix between each addition for 5 times until a blue-green colour is obtained. Record volume of dithizone solution added as an index of amount of metal.
  10. If blue-green or green dithizone stage is reached, all metal has reacted with dithizone and tube may be emptied and another test commenced without further cleaning of tube or cork. Ppm (parts per million) of THM is approximately equal to number of ml dithizone added. This calculation is based on equivalent of zinc concentration.
  11. If colour persists pink after 15 ml of dithizone added, repeat analysis by using the 0.10 gram scoop. The ppm will be 2.5 times the number of ml of dithizone added.
-

#### 4.3 Results

---

Over most of the claim area the soil sample results for THM (Pb,Zn,Cu) were background and typical for soil derived from heavy overburden . Contouring was attempted and generalized conclusion can be drawn. The soil over the area of cherty volcanic unit (1c) are some higher in THM values than the soils over the remainder of the property and appears to have northsouth trend.

Soils in certain locations along the north portion of the grid are somewhat higher in THM than the soil over the remainder of the north grid. Higher values of THM appears to occur around lines 200W and 400W-250N.

### 5 GEOPHYSICAL SURVEY

---

#### 5.1 Introduction

---

A magnetometer survey was conducted in the vicinity of baseline 0+00 -600E,0+00 -1850W and its crosslines to south and north.

The aim of this survey is to aid in the geological ,geochemical interpretation of the mentioned area and to add information in the area where overburden cover would reduce the effectiveness of these survey.

It was felt that a variation in the magnetic susceptibility of any major rock units would aid in outlining more precisely the buried contact and thus lead to the delineation of potential mineralization.

**SCINTREX****MP-2****Portable Proton  
Precession  
Magnetometer****Function**

The MP-2 is a portable one gamma proton precession magnetometer for field survey or base station use. The optimized design of sensor and circuitry using the latest COS/MOS components has resulted in a very light weight, low power consumption, rugged and reliable magnetometer.

Light emitting diodes coupled with an ingenious optically polarized reflector combine solid state reliability with easy reading even in bright sunlight.

Coupled with a module into which the MP-2 is easily inserted, the magnetometer can be used as a base station unit for analogue or digital recording. Full details of the MBS-2 Magnetic Base Station are available on another Scintrex specification sheet.

The noise-cancelling dual-coil sensor and electronics have been so designed as to effectively eliminate reading problems due to virtually all magnetic gradients which may be encountered in field survey conditions.

**Features**

1 gamma sensitivity and accuracy over range of 20,000 to 100,000 gammas.

Operates in very high gradients, to 5000 gammas per meter.

Ultra small size and weight.

Up to 25,000 readings from only 8 D cells.

Battery pack isolated from electronics for corrosion protection.

Battery pack easily extended for winter use.

Light emitting diode digital display, with complete test feature

Unique no-glare polarized reflector permits easy reading in bright sunlight.

Indicator light warning of excessive gradient, ambient noise or electronic failure.

Digital readout of battery voltage.

Rugged all metal housing for rough field use at all temperatures.

Automatic recycling or external trigger features permit ready conversion to base station use.

Short reading time.

Broad operating temperature range.

MP-2 console.

MP-2 in operation with Staff Sensor.

# Technical Description of the MP-2 Portable Proton Precession Magnetometer

MBS-2 Magnetic Base Station.

MP-2 in operation with Back Pack Sensor.

<b>Resolution</b>	1 Gamma
<b>Total Field Accuracy</b>	±1 Gamma over full operating range
<b>Range</b>	20,000 to 100,000 gammas in 25 overlapping steps
<b>Internal Measuring Program</b>	Reading appears 1.5 seconds after depressing Operate Switch, stays on for 2.2 seconds, for a total of 3.7 seconds per single reading.
<b>External Trigger</b>	External trigger input permits use of sampling intervals longer than 1.5 seconds
<b>Readout</b>	5 digit LED (Light Emitting Diode) readout displaying total magnetic field in gammas or normalized battery voltage
<b>Digital Output</b>	Multiplied precession frequency and gate times
<b>Base Station Mode</b>	MP-2 console slips into a base station module which provides external triggering as well as digital and analogue outputs. The complete unit is called the MBS-2 Magnetic Base Station.
<b>Gradient Tolerance</b>	Up to 5000 gammas/meter
<b>Power Source</b>	8 alkaline "D" cells provide up to 25,000 readings at 25°C under reasonable signal/noise conditions (less at lower temperatures). Premium carbon-zinc cells provide about 40% of this number.
<b>Sensor</b>	Omnidirectional, shielded, noise-cancelling dual coil, optimized for high gradient tolerance
<b>Harness</b>	Complete for operation with staff or back pack sensor
<b>Operating Temperature Range</b>	-35°C to +60°C
<b>Size</b>	Console, with batteries: 80 x 160 x 250mm Sensor: 80 x 150mm Staff: 30 x 1550mm (extended) 30 x 600 mm. (collapsed)
<b>Weights</b>	Console, with batteries: 1.8 kg Sensor: 1.3 kg Staff: 0.6 kg
<b>Standard Accessories</b>	Sensor, Staff, Cable, Harness, Carrying Case, Manual
<b>Shipping Weight</b>	Approximately 9.5 kg
<b>Optional Accessory</b>	Cold weather battery pack.

## 5.2 Method

---

A Scintrex magnetometer, MP-2 proton precession magnetometer was used for this survey. This is a hand held instrument with one gamma sensitivity and accuracy over 20000 to 100000 gammas. It operates in very high gradients to 5000 gammas per metre.

Along the baseline and crosslines ,reading were taken at 50 metres intervals and where a wide range between the high and low reading was discovered,the spacing for reading was closed to 12.5 metres.

Loops were run to the base line and crosslines and corrections made for diurnal variation accordingly. The reading were filtered for any geologic/magnetic noise by running an average to the readings and these latter were also corrected for any diurnal variation or the heating effect by removal of the regional gradient,namely 57000 gammas,thought to remove the relevant errors.

## 5.3 Results

---

The ground magnetic show good correlation with geological and geochemical surveys. In detail lines 200W-1000W and 400S is good anomalies,trend northsouth matching the cherty unit (1c) ,where there are known disseminated sulphide mineralization. A detail survey in this area would be helpful to outline this unit.

At the north portion of the baseline,isolated magnetic hige represent sulphide mineralization in various volcanic units.

The low reading in the south end of the grid reflect the southern contact with the cherty unit (lc) of volcanic rocks.

## 6 SUMMARY AND CONCLUSION

---

- 1) The property comprises of a north-northwest quartz diorite stock emplaced into altered Anarchist volcanic assemblage.
- 2) The volcanic rocks are variably altered, consisting of cherty and massive units.
- 3) The programme has effectively narrowed the exploration potential to the area of cherty unit, though some potential exists within the volcanic units (la,lb).
- 4) Sulphide mineralization is widespread on the property, but only achieves significant strike length and width within the cherty unit between lines 300W-850W and 750S ,400W-550N.
5. The mineralized quartz vein system may occur on the property, but has only been found in two locations.
6. Geophysical mangnometer and soil sampling survey reveal that anomalies areas occur within lines 300W-850W and 750S,400W-550N.
7. More detailed exploration, geological mapping, trenching, sampling, geophysical and geochemical surveys could usefully be carried out in the cherty volcanic unit (lc) and the rest of the property.

## 7 RECOMMENDATIONS

---

A programme of further work is justified to trace and delineate the trend of the cherty unit (1c) within the volcanic assemblage between the lines 300W-850W and 750S, 400W-550N . This can be done with more detailed magnetometer ,VLF-EM surveys using the present north 43° east grid system

These lines should geochemically be sampled at close spaced intervals, followed by a detailed Cat trenching,geological mapping and sampling.

The target in this area is possible gold,silver and copper mineralization associated with sulphide within the cherty unit (1c) of volcanic rocks of Anarchist unit.
