INDEX MAP

INTRODUCTION

The J.One-Mac property of Nakusp Resources is situated in the Monashee Mountains area of the Vernon Mining District, south-central B.C.

Interest arises from several silver-gold veins with a long history of exploration and intermittent production, in the nearby Monashee Pass and Monashee Mountain areas.

Reconnaissance geochemical sampling and geological mapping surveys were carried out on the claims during the period September 9 - 22, 1983 by I.M. Watson and Associates Ltd., as part of a preliminary survey of the area's precious metal potential.

PROPERTY, LOCATION AND ACCESS

The J.One-Mac property comprises six two-post claims and one 20-unit mineral claim located on Yeoward Mountain, 17 km southeast of Cherryville and 60km east-southeast of Vernon. The NTS map reference of the area is 82L/1W.

The claims are held by Nakusp Resources Ltd. under option from J. Graves of Vernon, B.C. Details of the Group are as follows:

Claim Name	Record No.	Expiry Date	No. of Units/Claims
Mac 1 - 6	1294-1299	Nov. 2/83	6
J. One	1176	Nov. 19/83	20
		TOTAL	26

The property is accessible by four-wheel drive vehicle via Highway 6 and the Keefer Lake logging road. The Keefer Lake turnoff is approximately 30 km south of Cherryville. From there, a good gravel road heads northeast along the west

side of the Kettle River. A forestry road joins the Keefer Lake road immediately before it crosses to the east side of the Kettle River, a distance of about 9 km from the highway. From there, a 7 km long, rough, four-wheel drive road heads northeast and then north to the property and the summit of the Yeoward Mountain (El. 2150 m).

The property straddles the upper slopes of Yeoward Mountain. The claims cover the steep cirques on the north face and the upper alpine meadows of the summit area. To the south, the slope gradually steepens and below the tree line (1860 m), the southern part of the property is covered by dense mixed evergreen forest, mainly of pine and balsam. Lowest elevation on the property is 1525 m.

Bed rock is well exposed in the summit area of the mountain, particularly along the northern cliffs and steeper eastern slopes.

HISTORY

Records of placer gold and hard rock mining in the area date back to the late 1800's. Gold placer deposits are known in the Cherryville area to the north and in the Kettle River to the south. There is an active placer operation on Monashee Creek 8 km west of the claims and signs of recent placer activity were evident near Marsh Creek 9 km south of the claims.

Hard rock mining activity in the area dates back to 1886 when Crown grants were staked in the Monashee Pass area 8 km to the southwest. Periodic work on those claims included underground development and the operation of a mill on the Withrow Crown grant. The mill was dismantled in the 1940's and only the foundation remains. There is also a record of production from the Monashee St. Paul mine which is located on Monashee Mountain approximately 2 km south-west of the claims.

There is no record of activity on the J.One-Mac claims.

GEOLOGY

1. Regional Geology

The property is underlain by volcanics and sediments of the Upper Triassic-Lower Jurassic Nicola Group (Okulitch and Campbell, 1979). The regional trend is east west, with variable dips.

2. J.One-Mac Property (Dwg. 83ME9)

A reconnaissance mapping survey of the property was completed during the period 9th to 21st September 1983. Mapping control was provided by government topographic map enlargements (1:5000 scale), and air photos, combined with pace, compass and altimeter traverses.

Lithology - The dominant rock type found throughout the property is andesitic volcanics (TRJNv) consisting of flows, tuffs, and breccias. The andesites weather grey-green and range from fine grained and massive to porphyritic (feldspar). Within the andesites, there are thin but distinctive units of grey fine grained limestone (TRJNc) and a brown weathering coarsely crystalline feldspar porphyry (TRJNvp). The limestone is exposed on the summit of Yeoward Mountain. It occurs as a narrow, north-westerly striking bed between fine grained andesitic flows or tuffs. The porphyry outcrops at the top of the cliffs just east of the mountain summit. Contact relationships are not clearly exposed, but it is possible that the porphyry is a sill.

Black shales (TRJNs) form a significant part of the succession on the property, occurring not only as narrow beds within the volcanics but as a readily distinguishable unit outcropping just west of the summit and on the eastern upper slopes of Yeoward Mountain.

Pegmatite float, consisting of large boulders of coarse quartz-feldspar-muscovite, forms a 200-metre long south trending train just east of the mountain summit. No outcrops of the pegmatite could be found, and it is devoid of sulphides.

Structure - Structure attitudes have been determined from lithological contacts, from bedding in sediments and tuffs and from foliation developed throughout the sequence. The general trend of both bedding and foliation is northeasterly, with moderate south-easterly dips.

No folding has been observed.

North striking, steeply dipping fractures cut the andesite in the north-western portion of the property, as noted above, but there are no observed major faults or displacements.

Mineralisation - Pyrite is the only sulphide mineral encountered on the property.

Weakly disseminated pyrite occurs in a narrow rusty weathering quartz-carbonate vein cutting andesites exposed on the upper cliff face on the MAC 3 claim. The vein is one of several which occur in northerly striking, steeply dipping fractures on the northern face of the mountain, but it is the only one bearing sulphide mineralisation. A geochemical rock analysis of the vein material failed to reveal any significant metal content.

Samples were also taken from rusty weathering pyritised and silicified argillite outcropping at 2057 m elevation on the MAC 4 claim; and from pyritic tuffs exposed on the Yeoward Mountain access road at the 1870 m elevation. Neither was anomalous.

GEOCHEMISTRY

1. Sampling Method

A four-man crew carried out the reconnaissance soil sampling survey during the period 19th - 21st September 1983. A total of 397 soil samples were collected at 100-metre spacing along contour line traverses. On steep

terrain, contour separation of 60 m (200') were used. On gentler slopes, the separation was reduced to 30 m(100'), and on the flat summit area, evenly spaced traverses were made.

Altimeters, compasses, hip chains and government topographic map enlargements were all used as sampling controls.

2. a) Analysis and b) Data Treatment

a) Analyses were done at Acme Analytical Laboratories in Vancouver. A -80 mesh fraction of soil was analysed by the inductively coupled argon plasma method (ICP) and a separate analysis for gold was carried out by atomic absorption (A.A.).

The 30 elements reported by the ICP analysis method are as follows:
Mo, Cu, Pb, Zn, Ag, Ni, Co, Mn, Fe, As, U, Au, Th, Sr, Cd, Sb, Bi, V, Ca, P, La, Cr, Mg, Ba, Ti, B, Al, Na, K, W.

The sample is prepared by dissolving 0.5 grams in hot aqua-regia (3:1:3 nitric acid to hydrochloric acid to water) at 90°C for 1 hour. This is diluted to 10 ml water and converted to an aerosol.

A brief description of the ICP analysis is as follows: high frequency currents in a few turns of induction coil (powered by a high frequency generator) surround a plasma cell and generate a magnetic field. The cell consists of argon plasma enclosed between two concentric quartz tubes surrounding a glass samples injector. The plasma gas is seeded with electrons - resulting temperatures range from 7000 to 10,000°K.

The sample, in aerosol form, is injected into the centre of the cell and rises into the doughnut-shaped plasma ring. The high temperatures vaporize the sample and dissociate molecular species. Spectral intensities of the excited sample are recorded and compared with standards by a computer controlled spectrometer.

b) The anomalous level for each element was statistically established from the ICP analytical data as the mean plus two standard deviation.

Five elements (Ag, As, Cu, Pb, and Zn) were determined to be of geochemical significance. Results of these elements, as well as gold (A.A. analysis) were plotted on the accompanying plans at a scale of 1:5000 (Dwgs. 83ME2 to 83ME7). Threshold/anomalous concentrations established for these elements are as follows:

Au - 30ppb; Ag - 2.0ppm; As - 80ppm; Cu - 90ppm; Pb - 25ppm; Zn - 261ppm.

The format used is a series of siz size-graded solid circles, each representing a different and equal range of values, the largest being anomalous. The readily visible density contrast patterns reveal not only statistically derived anomalies, but any significant trends of the individual elements. Analytical results for Mo, Ni, Co, Mn, Fe, U, Th, Sr, Cd, Sb, Bi, V, Ca, P, La, Cr, Mg, Ba, Ti, B, Al, Na, K, and W were also appended to this report. These may be keyed to sample number locations provided on drawing no. 83ME8.

3. Discussion of Results

The distribution of metals in soil indicates a main area of interest in the northwestern corner of the property. Roughly coincident silver, zinc and arsenic anomalies occur in the soils on the upper western slopes of Yeoward Mountain, covering an area about 600 m x 800 m. The arsenic concentrations are stronger on the eastern side of the anomaly close to the mountain summit and the northern cliffs. The higher analyses in this area (e.g. 151ppm, 291ppm) come from samples taken close to the zone of fracturing and quartz veining described earlier in this report. Zinc and silver trends correlate closely, but none of the volcanics and sediments outcropping in the immediate area provide any reason for the elevated analyses.

Gold content in soils is low throughout most of the property. There is a scattering of 'one-spot highs' along the western slopes of the mountain, including a 1300ppb sample taken from a seep near the western boundary of the J.One claim. There is also a zone of scattered low to moderately anomalous

samples (35 - 215ppb Au) along a southeasterly trending spur in the southeastern corner of the J.One claim.

There are no well defined copper or lead anomalies or trends. Copper levels tend to be generally higher in the northwestern and southeastern areas mentioned above. Soils also show slightly elevated lead contents in the northwestern area.

SUMMARY

The geological-geochemical reconnaissance appraisal of the J.One and MAC claims has delineated an area of interest requiring follow-up detail sampling and prospecting, followed by trenching if results are favourable.

A silver-arsenic-zinc anomaly in the northwestern part of the property occurs in soils underlain by Nicola Group volcanics and sediments. No mineralisation was observed to account for these anomalies, but they may be related to a north-trending zone of fracturing, veining and weak alteration exposed on the MAC 1, 2, and 3 claims.

A disperse, weak to moderate gold anomaly in the southeastern part of the J.One claim also requires further investigation.

COST STATEMENT - MONASHEE EAST GROUP - J.ONE AND MAC 1-6 CLAIMS

Geological and geochemical surveys - 9 - 21 September 1983.

Salaries and Fees

a) Field Work			
U. Schmidt - project geologist (9, 19-21 September)	5 days @ $200.00/day	$ 1,000.00	
R. Krawinkel - prospector (19 - 21 September)	3 days @ $100.00/day	300.00	
B. Dent - prospector (19 - 21 September)	3 days @ $100.00/day	300.00	
D. McDonald - propsector (19 - 21 September)	3 days @ $100.00/day	300.00	
D. Seaton - prospector (19 - 21 September)	3 days @ $100.00/day	300.00	
R. Allen - prospector	1 day @ $125.00/day	125.00	
b) Report Preparation			
U. Schmidt	3 days @ $200.00/day	600.00	$ 2,725.00
Room and Board			
*16 man days @ $28.50/man/day			456.00
Transportation and Fuel			
*Two 4X4 trucks - 4 days @ $36.65/day/unit		293.20	
Fuel - 221 litres @ 50.8¢/litre		112.27	405.47
Geochemical Analyses			
30 element ICP + Au (A.A.)			
397 soils @ $9.90/sample		3,930.00	
4 pan cons. @ $9.90/sample		39.60	
4 rock samples @ $9.90/sample		39.60	4,009.20
Equipment Purchase			
27 rolls topo fil @ $3.50 each		94.50	
405 sample bags @ $13.75/100		55.69	
40 rolls flagging @ $1.10		44.00	207.94
Equipment Rental			
*4 hand held radios - 4 days @ $2.50/day/unit		40.00	
*1 mobile radio - 4 days @ $2.50/day/unit		10.00	50.00
Reproduction, Maps			422.32
	TOTAL COSTS		$ 8,275.93

*Prorated costs

PROFESSIONAL ENGINEER PROVINCE OF BRITISH COLUMBIA I. M. WATSON

I.M. WATSON & ASSOCIATES LTD.

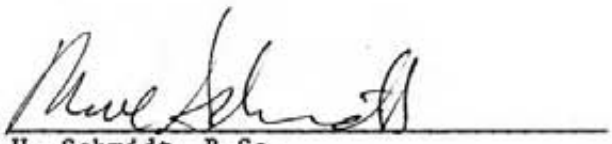
STATEMENT OF QUALIFICATIONS

I, Uwe Schmidt, with residential address in Port Moody, B.C., do hereby declare:

- I am a 1971 graduate of the University of British Columbia with a B.Sc. degree in Geology.

- Since graduation, I have been engaged in mineral exploration in Yukon Territory and British Columbia.

January 20, 1984
Vancouver, B.C.



U. Schmidt, B.Sc.

CERTIFICATE OF QUALIFICATIONS

I, Ivor Moir Watson, of 584 East Braemar Road, North Vancouver, hereby certify that:

1. I am a consulting geologist with offices at 410 - 675 West Hastings Street, Vancouver, B.C.

2. I am a graduate of the University of St. Andrews, Scotland, (B.Sc., Geology, 1955).

3. I have practised by profession continuously since graduation.

4. I am a member in good standing of the Association of the Professional Engineers of B.C., and a Fellow of the Geological Association of Canada.

5. Work on the J.One-Mac Group was carried out by the following people:

   U. Schmidt, project geologist
   R. Krawinkel, sampler
   B. Dent, sampler
   B. MacDonald, sampler
   D. Seaton, sampler

January 20, 1984
Vancouver, B.C.

LEGEND

AGE UNKNOWN

⊗ Quartz-feldspar-muscovite-garnet pegmatite

UPPER TRIASSIC AND LOWER JURASSIC

NICOLA GROUP

TRJNv Grey to grey green weathering, med. grained to porphyritic andesite, abundant brecciated varieties, tuff.

TRJNc Limestone

TRJNvp Pale brown weathering, porphyritic andesite

TRJNs Black argillite, interbedded with and in sharp conformable contact with variable tuffs

Limit of outcrop

Limit of sub-outcrop and abundant small outcrops

x Float: Qtz = Quartz

Quartz vein; inclined

Geological boundary: defined, approximate, assumed

Bedding: inclined

Foliation: inclined, vertical

Joints: inclined, vertical

Fault: defined, assumed

Claim post: located by hip chain, compass and altimeter survey

Four-wheel-drive road
