INTRODUCTION

General Statement

The report summarizes the results of a single 211 m NQ diamond drill hole designed to test an iron-stained breccia zone. The hole was collared at an elevation of 1480 m near the centre of the Heap 1 claim and was drilled at -70° on a bearing of N 30° W.

The drilling contractor was Arctic Diamond Drilling of Whitehorse with helicopter support provided mainly by a Hughes 500D owned by Canwest Helicopters of Okotoks, Alberta. During drill moves a T.N.T.A. Bell 204B (Whitehorse) and a Frontier Bell 205 (Watson Lake) were utilized.

Tony Hitchins, Geoff Booth and Tom Robinson of Canamax logged and split the drill core.

The core is presently stored at Twilight Services in Watson Lake, Y.T.

Location and Access

The Heap 1 and 2 claims of the Tootsee River property are located adjacent to the B.C. - Yukon border 29 km southeast of the village of Rancheria on the Alaska Highway.

Access is by helicopter from Watson Lake 75 km to the east or from Rancheria during the field season.

Previous Work

The claims were staked in 1979 to cover the apparent source of a tungsten silt anomaly. Work in 1979 and 1980 concentrated on geological mapping and prospecting. In 1983 a topofil and compass grid provided control for soil geochemical and magnetic surveys in the central portion of the Heap 1 claims.

RESULTS

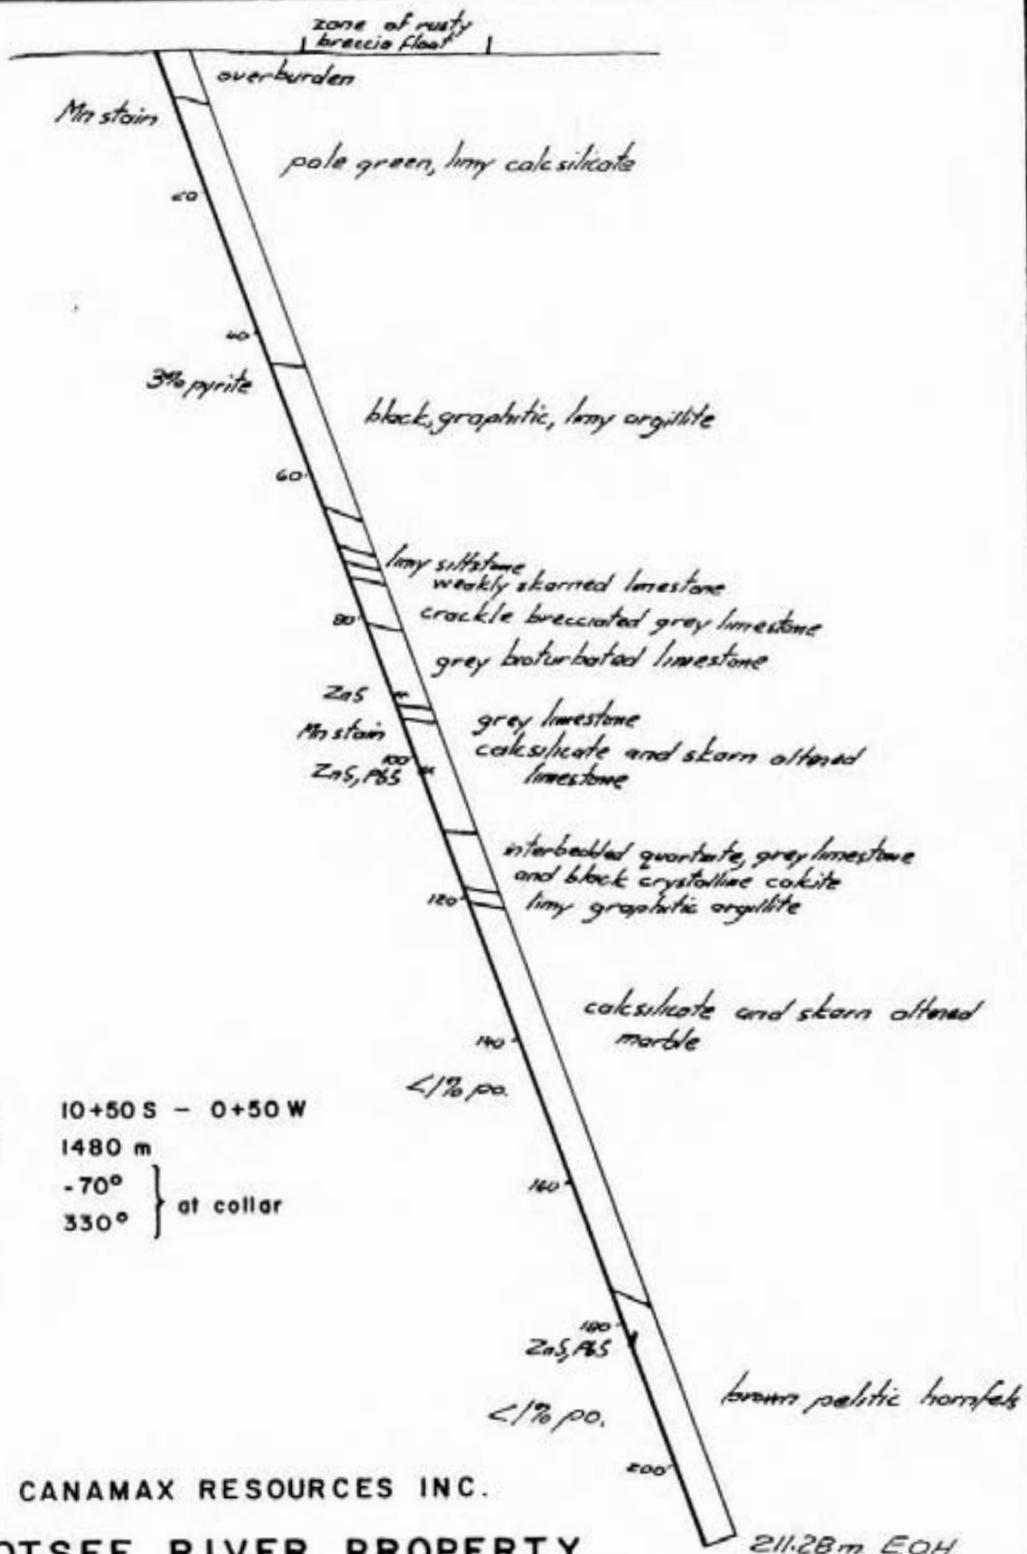

The hole intersected 175 m of weakly calcsilicate and skarn altered calcareous flat lying strata before entering brown and green slightly fractured pelitic hornfels. Silicified brecciated limestone and crackle brecciated limestone between depths of 74 and 81 m may be the downward extension of the strongly iron stained breccia float exposed immediately north of the drill collar.

Minor clusters of reddish sphalerite and galena were noted in altered carbonate rocks at 102 m and in narrow veins in pelitic hornfels at 182 m.

Geochemical and assay values for all core samples are summarized in Table 1.

<u>Survey Summary</u>				<u>Pertinent Assay Data</u>		<u>Pertinent Geology</u>	
Depth	Dip	Bearing	Method	Interval	%	Interval	Rock Type

DEPTH METRES	GRAPHIC LOG				% REC.	ASSAY INTERCEPTS	ASSAY DATA					SIZE WO ₃		NOTES
	LITH.	BEDDING	FAULTS	NUMBER OF PIECES			SAMPLE NO. AND INTERVAL	% WO ₃	% MoS ₂	VIS. EST. WO ₃				
0 to 6.76														Overburden
6.76 to 28.65		50°												Light green to greyish well foliated calcsilicate and light coloured skarn with scattered talc and Mn stained patches and fractures, core is softer than most calcsilicate (probably surface weathering)
														6.76-7.93 leached, friable
														19.7 - 21.0 weakly brecciated, fractures open
														27.7-28.65 talc filled fractures at 10°-50° to C.A.
28.65 to 28.85		60°												Medium grey limestone with small greyish needles (amphibole?) cut by 5 mm calcite veins at 45° to C.A.
28.85 to 44.15		70°												As for 6.76-28.65 scattered talc and Mn stained fractures parallel to C.A., rapid transition into underlying unit
														35.87-36.8 Limy grey calcsilicate with calcite-muscovite veins up to 1 cm wide 45° to C.A.
44.15 to 64.5		70° 50°												Black graphitic, limy argillite; well banded with 3% disseminated pyrite; carbonate-quartz-pyrite ± talc veins up to 1 cm sometimes with brecciated margins, 34 veins in 4.2 m
														45.31 drusy calcite in narrow slip zone
														50.2-54.8 20 pyrite-calcite threads to narrow veins
														Section is quite competent with core up to 30 cm long rarely <1 cm, calcite-pyrite concretions to 20 cm length
														55.5-56.23 broken core, 1 cm wide brecciated veins with quartz-calcite (minor pyrite) matrix, graphitic slips
														57.7 1.5 cm pyrite band parallel to foliation (50°)

DEPTH METRES	GRAPHIC LOG				% REC.	ASSAY INTERCEPTS	ASSAY DATA					SIZE WO ₃ I Fine 5 Coarse			NOTES
	LITH.	BEDDING	FAULTS	NUMBER OF PIECES			SAMPLE NO AND INTERVAL	% WO ₃	% MO S ₂	VIS. EST. WO ₃					
64.5 to 69.3															62.5 harder more siliceous towards base, increase in qtz-cbt veins to 5% of core
															Medium grey very weakly skarned limestone, locally well foliated
															64.63 10 cm of broken core with Mn stain
															69.1 20 cm of slips and gouge at 30°-60° to C.A. Talc and a rusty weathering pale green fibrous mineral on slips
69.3 to 71.86		60°													Dark well banded slightly limy siltstone, locally graphitic, gradational lower contact, irregular qtz-cbt veins to 1 cm
71.86 to 74.7															Medium grey weakly skarned limestone 71.8 leached rusty bands parallel to foliation
															73.5-74 rusty, soft broken zone, drab green 3 mm qtz-cbt vein extends along core axis from a slip in this zone
															73.9-74.4 breccia, lower contact is sharp - about 30° to C.A. Upper contact is diffuse or fragments become larger, fragments are angular and silicified in a light grey siliceous matrix, second stage brecciation has incorporated earlier silicified fragments in a yellowish grey matrix. Breccia ends in a 4 cm fine grained light grey silica vein or bed ? with a lower irregular contact at 90° to C.A.
74.7 to 81.4															Dark grey weakly crackle brecciated massive to bedded limestone becoming dolomitic towards base. Trace skarn and disseminated pyrite, irregular fractures partially filled with drusy calcite, narrow bleached zones along some hairline fractures

DEPTH METRES	GRAPHIC LOG				% REC.	ASSAY INTERCEPTS	ASSAY DATA					SIZE WO ₃		NOTES
	LITH.	BEDDING	FAULTS	NUMBER OF PIECES			SAMPLE NO. AND INTERVAL	% WO ₃	% MoS ₂	VIS. EST. WO ₃				
														107.5-110.7 rusty broken core, pyrite on most fracture surfaces, purple fluorite with pyrite in some 2-3 mm veins
10.7 to 18.54														Mixture of medium to dark grey quartzite (50%), dark grey foliated limestone and black coarsely crystalline calcite; pyrite filled fractures in quartzite and dark grey limestone
														112-113.11 broken core, poor recovery
														117.2-117.3 brecciated grey quartzite with pyrite and chlorite on fractures
														118.15-118.54 as above
18.54 20.5		60°												Dark grey, well banded, very limy graphitic argillite; scattered white calcite veins to 1 cm, minor pyrite on fractures; sharp lower contact.
20.5 74.7														Light grey, well banded calcsilicate and locally skarn altered marble, generally soft, irregular calcite veins about 10/1 m.
														128 first appearance of pyrrhotite
														129-139.5 veins rare, no sulphides
														146.8-150 felted hornblende (?) needles gives an almost diabasic texture to core
														156.55-158 coarsely crystalline veins and squiggles of pale green tremolite and calcite; slips coated with dull emerald green fuchsite. <1% pyrrhotite
														163.9-166.15 badly broken core, abundant calcite veins <1% pyrite in quartz-carbonate veins, numerous greasy slips, possible fault zone

DEPTH METRES	GRAPHIC LOG				% REC.	ASSAY INTERCEPTS	ASSAY DATA					SIZE WO ₃ 1 Fine 5 Coarse			NOTES
	LITH.	BEDDING	FAULTS	NUMBER OF PIECES			SAMPLE NO. AND INTERVAL	% WO ₃	% MoS ₂	VIS. EST. WO ₃					
174.7 to 211.28		45°													168.5-172.8 abundant calcite-quartz veins 170.5-171.5 } light grey quartz with clusters of pale green 171.5-172.8 } tremolite
															Greenish brown, fine grained, well banded pelitic hornfels; fracturing, bleaching along fractures and pyroxene development along fractures increases with depth; light pink to lilac coloured alteration of brownish hornfels increases towards bottom of hole, <1% pyrrhotite in this section but po >> py
															180.2-181.3 broken core, abundant narrow quartz-carbonate veins, bleaching
															182.0-182.3 greenish hornfels after brown hornfels cut by 1-2 cm quartz-carbonate-sphalerite-pyrite-galena vein 5°-10° to C.A., vein has brecciated margins, sphalerite extends along foliation planes away from veins
															184.0-189.3 dark grey to black hornfels cut by scattered, bleached and pyroxene coated fractures, approx. 14 fractures/1 m., only trace pyrrhotite and pyrite on fractures
															189.3-195.8 interbanded brown, light grey, green and pinkish hornfels, hornfelsing appears to be bedding controlled.
															1 cm bands of calcisilicate with 5-10% pyrrhotite occur about every 40 cm
															192.0-192.7 broken core, quartz-calcite veins at 0°-40° to C.A., no sulphides
															195.8-200.3 fracture control to bleaching and development of pinkish hornfels is more prominent
