1.0 INTRODUCTION

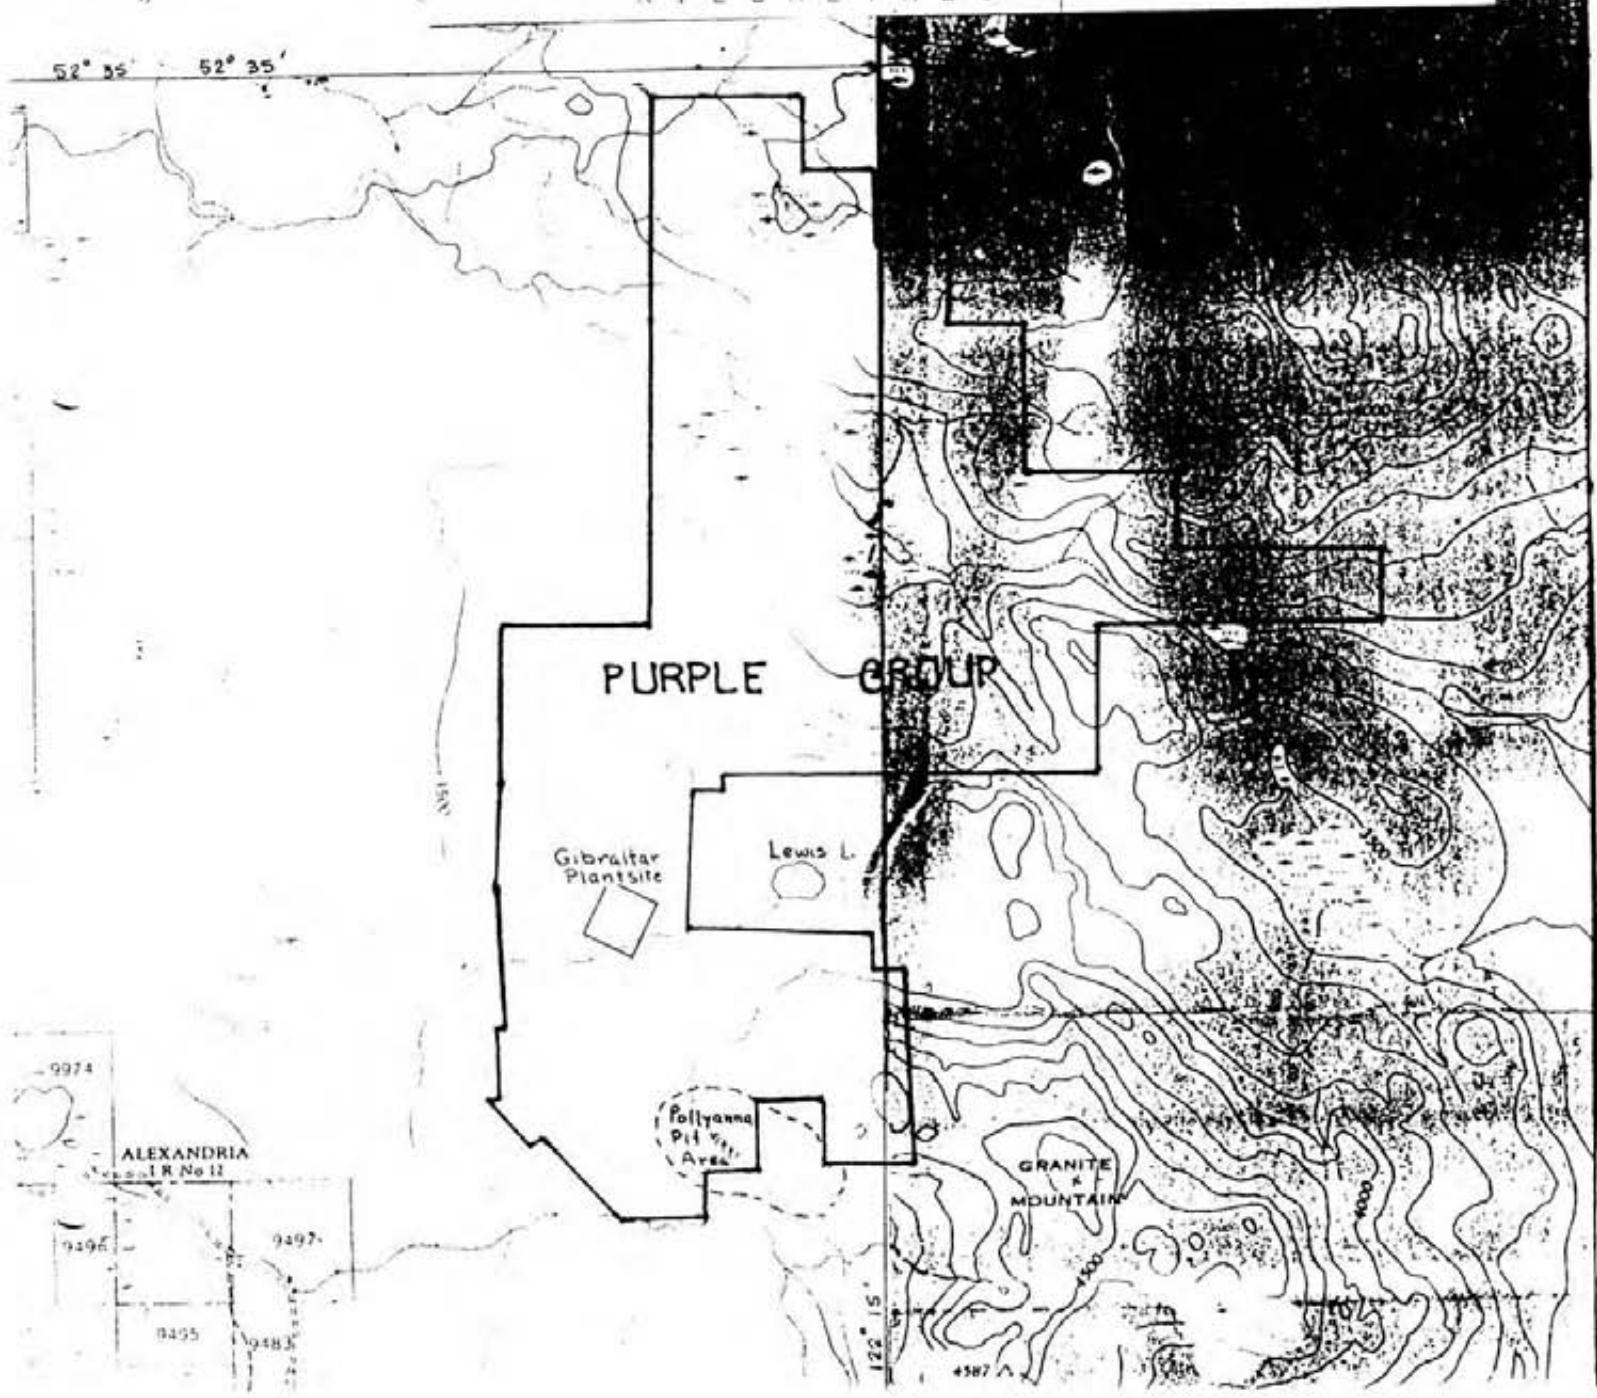

The Purple Group forms part of the Gibraltar Mines permanent property and includes a large portion of the tailings pond. The general location of the group is shown in Figure 1.

This report is concerned with the southern end of the Group which extends into the Pollyanna orebody. Here, four vertical N.Q. diamond drill holes were drilled during the period May 17 - May 29, 1984. Two of the holes were located west of the Pollyanna pit in order to test for a westward continuation of the main ore zone. The other two were located within the pit in order to test the grade and continuity of ore below the present pit. A total 1894 - feet (577.29 m) of drilling was completed. The contractor was G. & D. Drilling of 5425 Dallas Drive, Kamloops, B.C. Core is stored at the Gibraltar Mines plant site.

TOTAL UNITS 69

3.0 DRILL PROGRAM

3.1 OBJECTIVE

The purpose of this drill holes 84-07 and 84-08 was to test for a westerly continuation of the main Pollyanna ore zone which is presently exposed in the Pollyanna pit to the east. The purpose of drill holes 84-09 and 84-10 was to test deep projections of the main ore beneath the present pit.

3.2 RESULTS AND INTERPRETATION

Drill hole locations are shown in Figure 2. In all holes, the main host rock was the Mine Phase Quartz Diorite which consisted of about 45% pale green saussaritized plagioclase, 15% dark green chloritized mafics, and 30% medium grey quartz. In holes 84-09 and 84-10, the Granite Mtn. Phase contact was intersected. This rock type, which is interpreted to be a Trondhjemite, is the principle phase of the Granite Mtn. pluton and is believed to underlie the Mine Phase close to all the Gibraltar ore zones. It consists of about 45% quartz, 10% chloritized mafics and 40% saussaritized plagioclase. Leucocratic zones were noted in all holes - these rocks usually consist only of quartz and pale grey feldspar but in these holes, the leucocratic zones also included hybrid-like material resembling either Mine Phase, or more commonly, Granite Mtn. Phase. Mineralization encountered was pyrite, chalcopyrite and minor molybdenite, associated with various quartz-chlorite-sericite-epidote alteration assemblages in a complex system of veins, shears and shear zones.

Hole 84-07 was cased to 12-feet. From 12-feet to 40-feet a barren leach cap was intersected consisting of vuggy limonite-stained core. From 40- to 200-feet a limonite zone was recognized by an abundance of limonite, minor malachite and partially leached sulfides. A zone of primary mineralization was noted from 200-feet to the end of the hole at 480-feet. No significant zones of ore grade mineralization were recognized, and at this time the core has not been assayed. Of interest is the large amount of leucocratic material intersected in this hole and the complex hybrid-like nature of this rock from 330- to 466-feet.

Hole 84-08 was cased to 12-feet. From 12- to 145-feet a leach cap similar to that of 84-07 was intersected and from 145- to 200-feet, a limonite zone, also similar to 84-07, was encountered. A low sulfide primary zone occurred from 200-feet to the end of the hole at 461-feet, and contained .32% Cu and .15% MoS₂ over 100-feet from 320- to 420-feet; this was the only significant ore intersection in the hole. Molybdenite values appear anomalously high relative to copper below 90-feet. The very high molybdenite assays from 330- to 350-feet were due to a single steep quartz-molybdenite vein. The Mine Phase host rock below 145-feet appears to be finer grained and higher in quartz than normal - it could be a different rock type, possibly related to the Granite Mtn. Phase.

Hole 84-09 was collared on the 3815 Bench of the Pollyanna pit and cased to 40-feet. Mineralization was essentially primary. From 40- to 200-feet a pyrite zone was intersected below which the concentration of chalcopyrite appeared to show a significant increase. No assays are available at this time but visual estimates, which usually tend to be conservative, suggest that an ore zone has been intersected from about

3.2 RESULTS AND INTERPRETATION (continued)

190-feet to 350-feet. The Granite Mtn. Phase contact was intersected at 425-feet. A three-foot leucocratic zone occurred at the contact.

Hole 54-10 intersected similar mineralogy and geology as that of 54-09. It was collared on blasted rock of the 3815 Bench and cased to 64-feet. The mineralization was primary. A weak pyrite zone was intersected from 64-feet to 240-feet and below this, the copper grade appeared to increase. Available assays indicate the pyrite contains mainly waste. The ore zone according to visual estimates appears to start at 240-feet and extend to about 390-feet. The Granite Mtn. Phase Quartz Diorite was intersected at 363-feet. The contact zone appeared to be marked by a ten-foot zone of leucocratic material containing abundant clots of epidote.

4.0 STATEMENT OF EXPENDITURES

May 1984 Diamond Drilling, Purple Group

(a) Drilling costs

84-07	480'	@ \$13.50/ft.	\$6480.00
84-08	461'	@ \$13.50/ft.	\$6223.50
84-09	450'	@ \$13.50/ft.	\$5075.00
81-10	505	@ \$13.50/ft.	\$6790.50

			\$25569.00

(b) Vehicle

4x4 1980 Suburbans May 4, 17-19, 23-29	
11 days @ \$20/day	\$ 220.00

(c) Assay Costs

45 Cu - MoS2 assays @ 4.40/assay	\$ 198.00
----------------------------------	-----------

(d) Supplies

Core boxes, tags, bags, logs etc.	
95 boxes @ \$6/box = 570 + 60	\$ 530.00

(e) Personnel Costs

(1) Core Logging and Supervision	
G. Sysouth May 23-25, 28-30	
June 1, 4-6	
80 hrs @ \$31.25	\$2500.00

(2) Field Work and Sample Preparation	
E. Oliver May 4, 17-18, 22-25, 29-31	
June 1, 4-6	
112 hrs @ 20.00	\$2240.00

\$ 4740.00

TOTAL DRILLING COST \$31,357.00

JDG

5.0 CONCLUSIONS

Drill holes 84-07 and 84-08 did not intersect any westerly extensions of the main Poliyanna ore zone but rather, have raised the possibility of another plutonic rock type being present west of Poliyanna. Hole 84-03 suggests this environment might also contain more molybdenite than normal for the mine area. More drilling is required.

Drill holes 84-09 and 84-10 both intersected a significant chalcopyrite zone directly beneath a weak to moderate pyrite zone. This sulfide mineralization appears to overlie the Granite Mtn. Phase contact zone. More drilling is required to delineate this contact and investigate its relationship to sulfide zoning and grade distribution.

APPENDIX I

STATEMENT OF QUALIFICATIONS

I, Garry D. Bysouth, of Gibraltar Mines Limited, McLeese Lakes, British Columbia, do certify that:

1. I am a geologist.
2. I am a graduate of the University of British Columbia, with a B.Sc. degree in geology in 1966.
3. From 1966 to the present I have been engaged in mining and exploration geology in British Columbia.
4. I personally supervised this drill program, logged the core and assessed the results.

Garry D. Bysouth

LOCATION POLLYANNA WEST
 DATE COLLARED May 25, 1984
 DATE COMPLETED May 27, 1984

SCARS 5' LENGTH 150'
 DIP - 90°

LATITUDE 50° 09' 40" N
 DEPARTURE 51° 42' 00" E
 ELEVATION 3811.00'

CORE SIZE N.Q.W.
 SCALE ON LOG 1" = 10'

LOGGED BY G.D.B.
 DATE June 1, 1984

REMARKS This hole intersects the Granite Mtn contact.
