INTRODUCTION

This report is an account of an 1,157 foot (353 metres), five hole diamond drilling programme carried out on the Glen Hope property in August, 1984. The drilling was done on behalf of Sable Resources Ltd., 970 - 625 Howe Street, Vancouver, B.C. V6C 2T6, who presently holds an option on the property. The programme was in response to a recommendation for 2,500 feet of surface diamond drilling contained in an April, 1984 report to Sable by B.E. Spencer, P. Eng. of B.E. Spencer Engineering Ltd., 960 - 625 Howe Street, Vancouver, B.C. V6C 2T6.

The drilling was done by D.J. Drilling Co. Ltd. of 13135 - 20th Avenue, Surrey, B.C. using a Longyear 38 drill equipped with NQ rods.

Director supervision, core logging and sampling was done by J. Paxton, P. Eng. of Petralith Services Ltd., 5086 Topaz Place, Richmond, B.C.

General superivision was done by R.T. Trenaman, P. Eng. of Trenaman Mining Services Ltd., 960 - 625 Howe Street, Vancouver, B.C. V6C 2T6.

SUMMARY

During August, 1984, Sable Resources Ltd. drilled five holes totalling 1,157 feet (353 metres) on the Glen Hope property.

The first two holes were drilled to test the ground below a series of old trenches on strike with, and to the west of the vein structures explored by drilling and underground work in 1980 - 1981. Several wide bands of ankeritic alteration were intersected including several quartz veins and pyrite zones.

The remaining three holes were drilled to test the extension of a vein on which a 100 foot adit had been driven in the 1930's. Again, several wide bands of ankeritic alteration were intersected which included several quartz veins as well as the one located by the adit.

The quartz veins and pyrite zones intersected are similar to those which form ore bodies in the adjoining Taurus Gold Mine.

At the time of writing, assay results were not yet available.

PROPERTY AND OWNERSHIP

Sable Resources Ltd. holds an option to acquire a 100% interest in the Glen Hope property which consists of the following mineral claims:

<u>Claim</u>	<u>Record Number</u>	<u>Expiry Date</u>
Mack 1	515N	October 2, 1984
Mack 2	516N	October 2, 1984
Mack 3	517N	October 2, 1984
Mack 4	518N	October 2, 1984
Highgrade	929P	November 2, 1984
Hillside	928N	November 2, 1984
Hopefull	526N	October 2, 1984
Hopefull 1	523N	October 2, 1984
Hopefull 2	524N	October 2, 1984
Hopefull 3	525N	October 2, 1984

In addition, a fractional claim was staked by J. Paxton for Sable Resources Ltd. to cover a possible open area on the northwest boundary of the group. This was the Fur Fr. recorded on August 2, 1984.

The option terms call for annual payments of \$25,000 until the full purchase price of \$200,000 has been paid. The outstanding unpaid balance becomes due upon the commencement of commercial production.

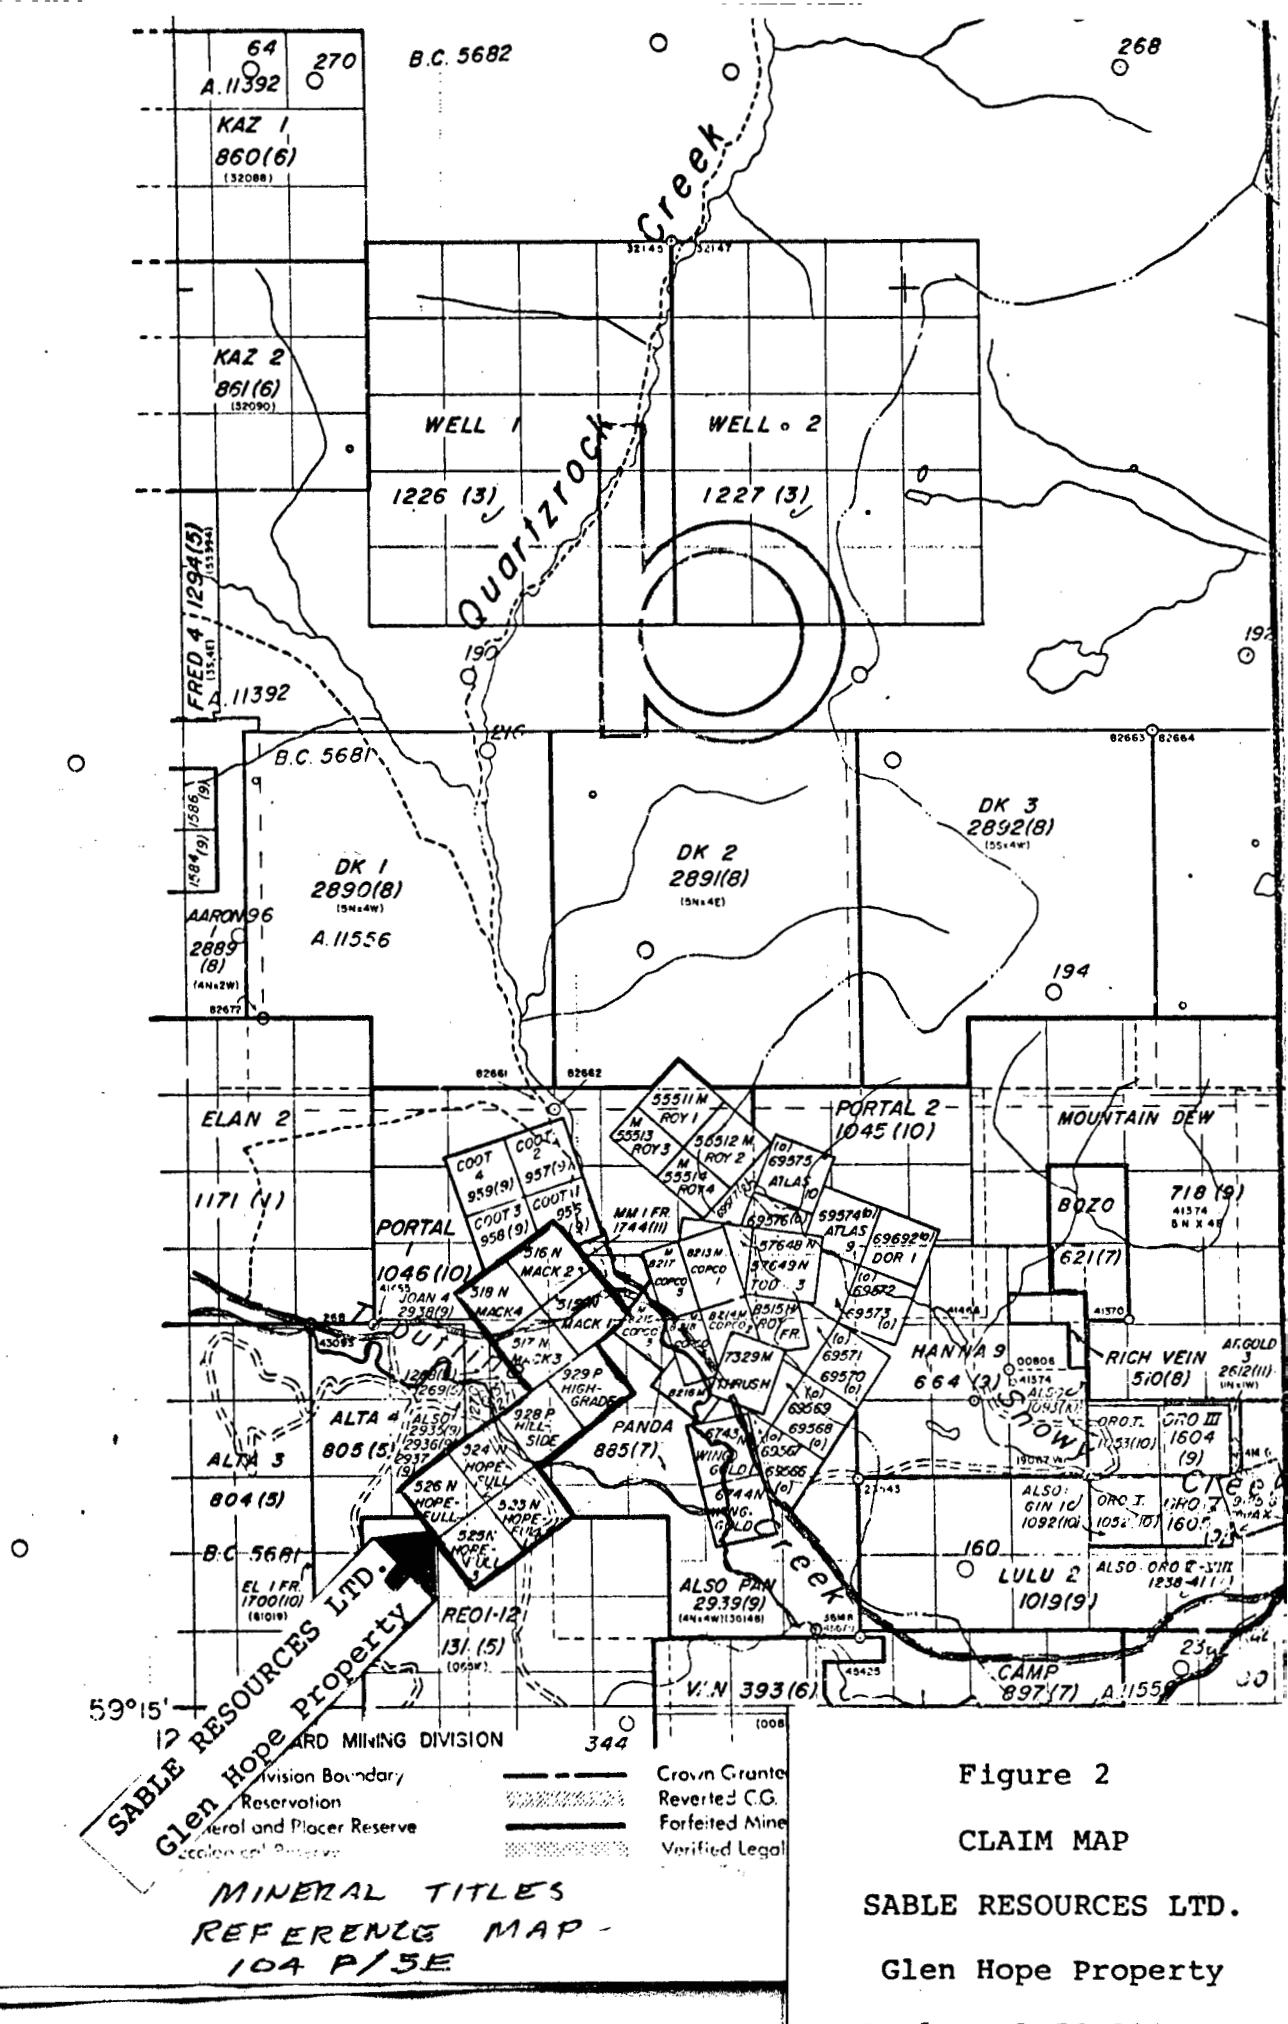

Figure 2

CLAIM MAP

SABLE RESOURCES LTD.

Glen Hope Property

Scale 1:50,000

LOCATION AND ACCESS

The property is located 5 kilometres east of Cassiar, British Columbia, on the branch road joining Cassiar to Highway 37. Highway 37 connects Watson Lake on the Alaska Highway to Stewart on the Pacific Coast. Watson Lake is 110 kilometres distant to the northeast and is the closest point with regular commercial air service. A daily bus service connects Watson Lake, Stewart and Cassiar.

The road to Cassiar crosses the northern portion of the property and from it a network of trails and drill roads provide easy access to most of its area.

HISTORY

According to a 1982 report on the property by B.E. Spencer, P. Eng., "the claims were located in 1934 by G. Hope, father of the present owner, who was a prospector and trapper as well as one of the earliest settlers in the area".

In the 1930's, G. Hope erected a small stamp mill and drove an adit over 100 feet on a nearby vein. He also prospected extensively, blasting numerous test pits and digging several bulldozer trenches.

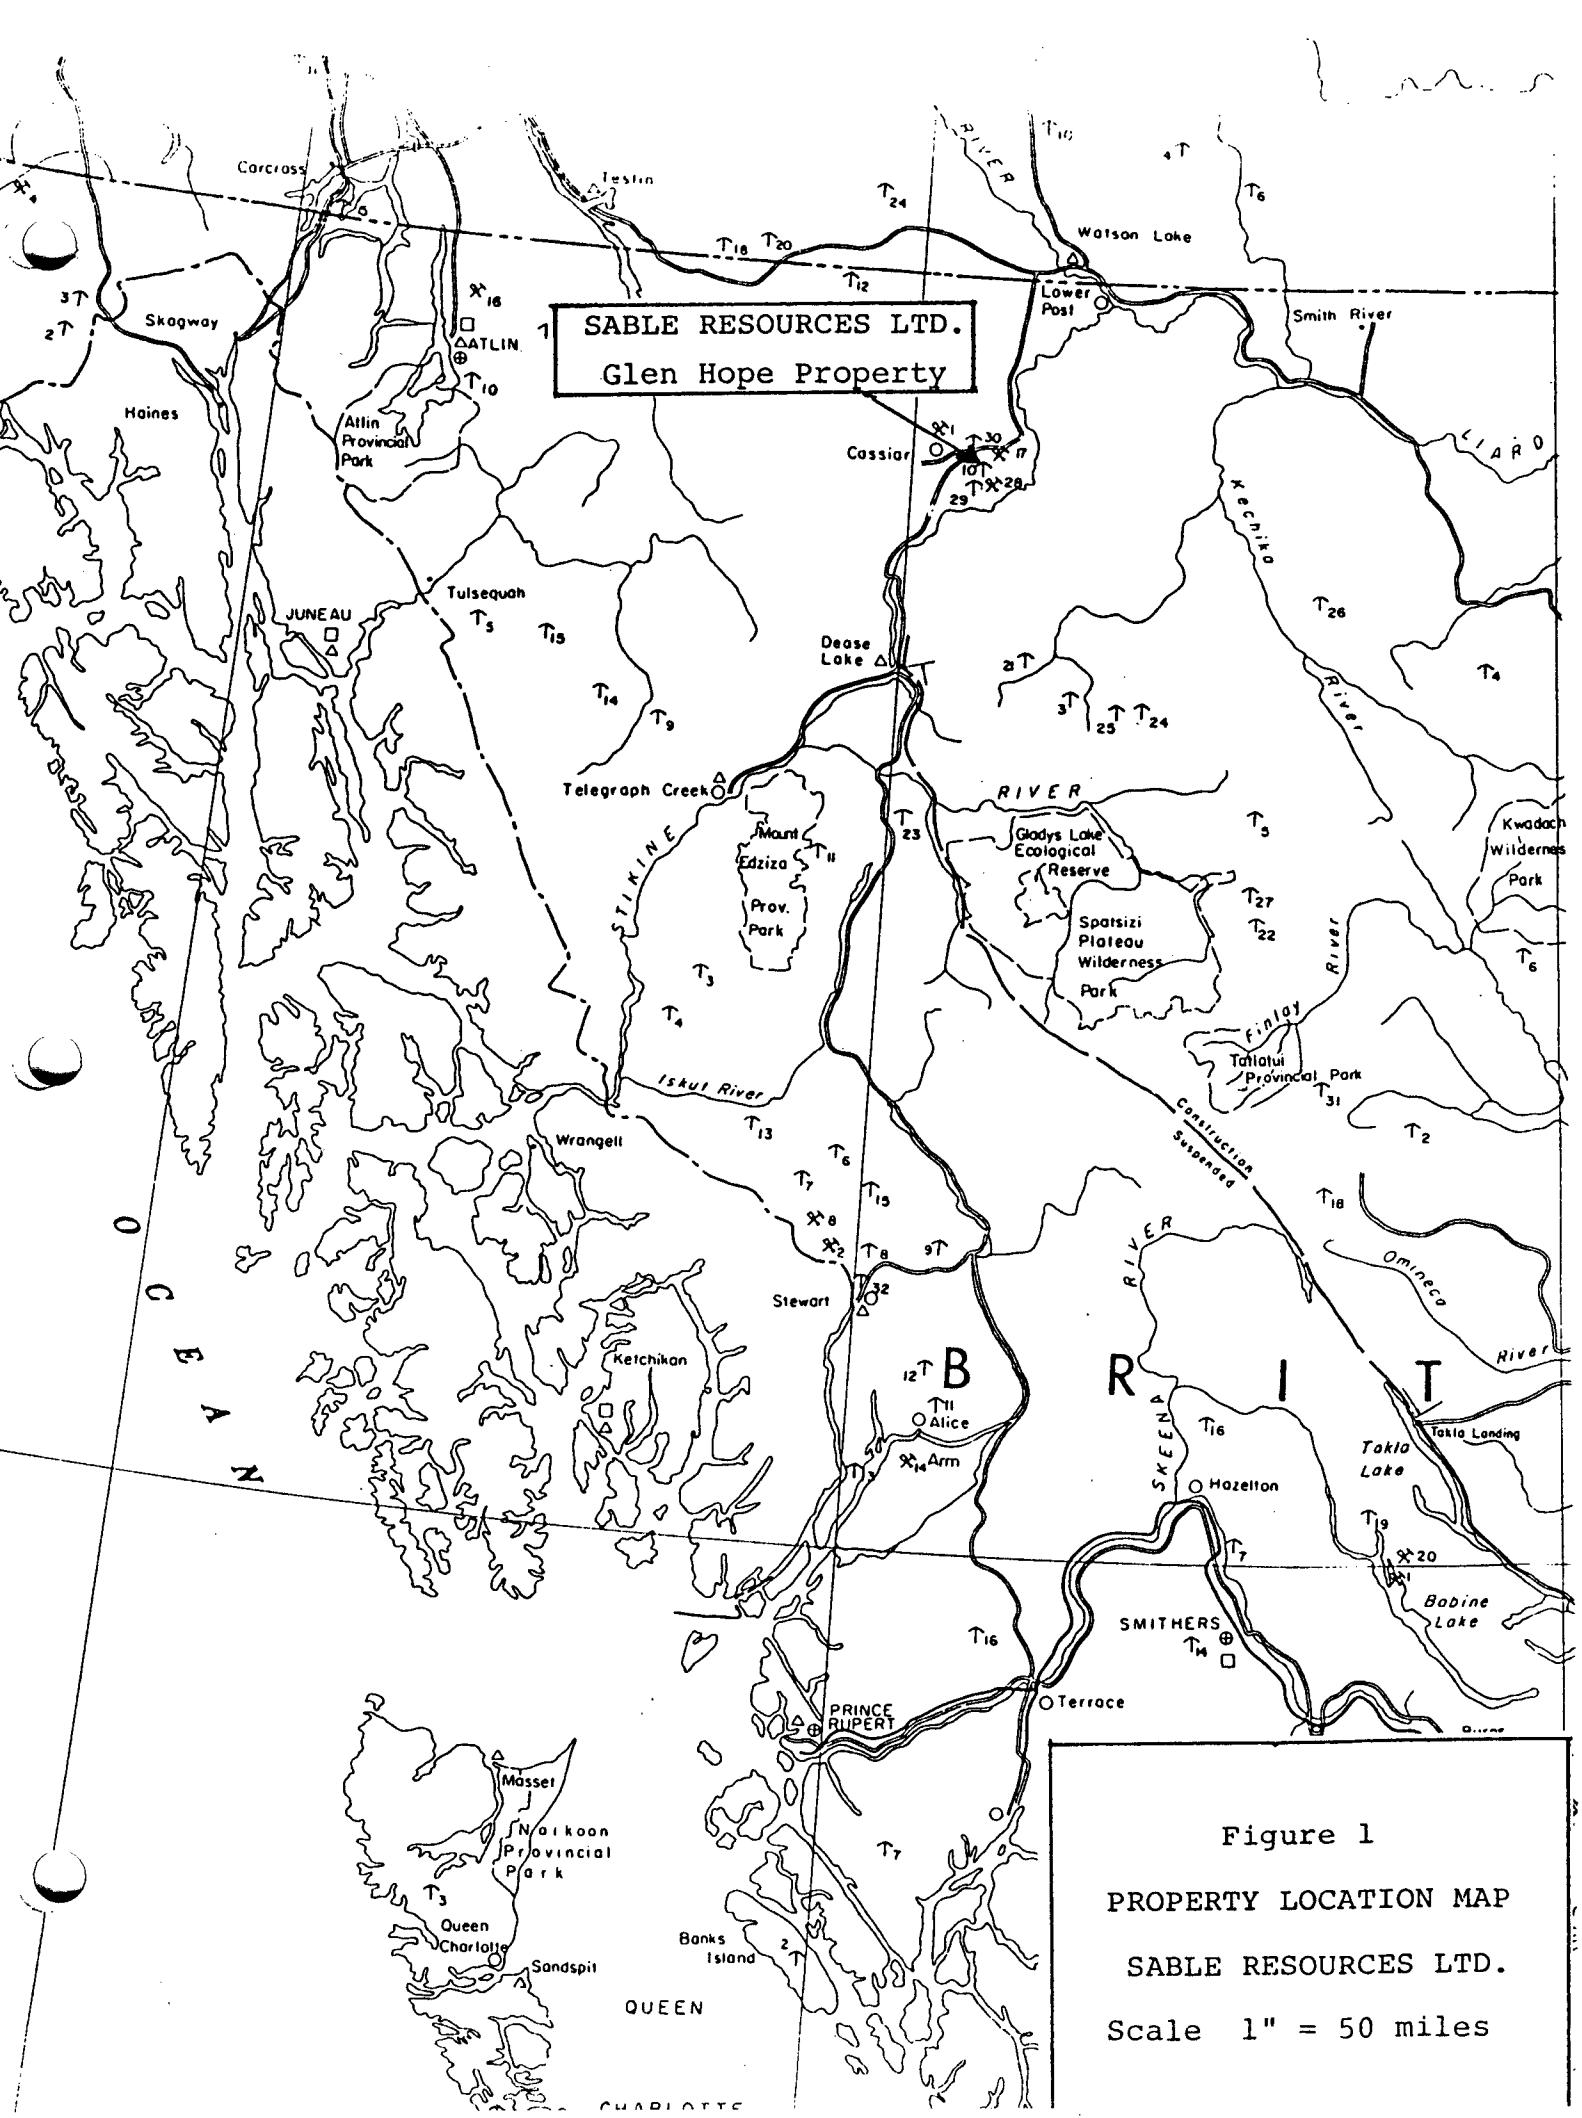

Figure 1
PROPERTY LOCATION MAP
SABLE RESOURCES LTD.
Scale 1" = 50 miles

In 1981, Plaza Mining Corporation took an option on the property. It conducted a geochemical soil survey for gold over the northern portion of the property. It also drilled 4,863 feet in 21 holes and drove a decline and three drifts underground totalling 1,115 feet.

GEOLOGY

The regional geology of the area is described in G.S.C. Memoir No. 319 and Map No. 110A and also more recently by A. Panteleyev and L.J. Diakow in the report entitled "Cassiar Gold Deposits - McDame Map Area", contained in the Ministry of Mines and Petroleum Resources publication "Geological Fieldwork 1981".

The property is underlain by rocks of the Sylvester Group of Mississippian Age. In the area where the drilling was done, the rocks of this group are massive greenstones which were originally andesitic pillow lavas with associated lenses of unbedded ash tuff. Occasional pillow and amygdaloidal structures can still be seen in the greenstone. In the gold-bearing areas, the greenstones are cut by vertical to steeply south dipping parallel groups of east-west trending fractures. These fractures have been occupied by pyrite followed by quartz. This vein formation has been accompanied by extensive and striking alteration of the greenstone to ankerite and pyrite. The pyrite occurs scattered

through the alteration zone as euhedral pyritohedrons and appears to be a product of the alteration process. Later fracturing has been accompanied by additional quartz and pyrite plus tetrahedrite, chalcopyrite, sphalerite, mariposite, gold and silver. Several phases of subsequent faulting have disrupted the vein structures in various ways.

The structural geology on the Glen Hope property is very similar to that of the Taurus Gold Mine which lies directly to the east and is in production at a rate of 150 tons per day.

RESULTS OF THE 1984 DRILLING PROGRAMME

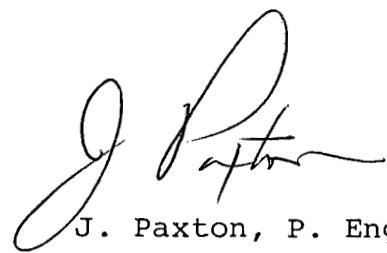

Drill holes 84-1 and 84-2 were laid out to test a zone of alteration and small quartz veins exposed in trenches to the east of the area drilled in 1981 by Plaza ~~west~~ Mining Corporation. The holes successfully located four bands of alteration which included several quartz veins and pyrite zones.

Drill holes 84-3, 84-4 and 84-5 were laid out to test the vein on which Mr. Glen Hope drove an adit in the 1930's. Again, several wide alteration zones were intersected including several strong quartz veins in addition to the one that the adit was driven on.

In both locations, the alteration zones are open on strike, and a good deal of additional drilling would be justified if the assay results from the present programme indicate ore grade material. At the time of writing, assay results were not available.

The drill core from the programme is presently stored in permanent storage racks in an old building on the Mack 1 claim as shown on the surface plan.

JP:lm

A handwritten signature in black ink, appearing to read "J. Paxton".

J. Paxton, P. Eng.

CERTIFICATE

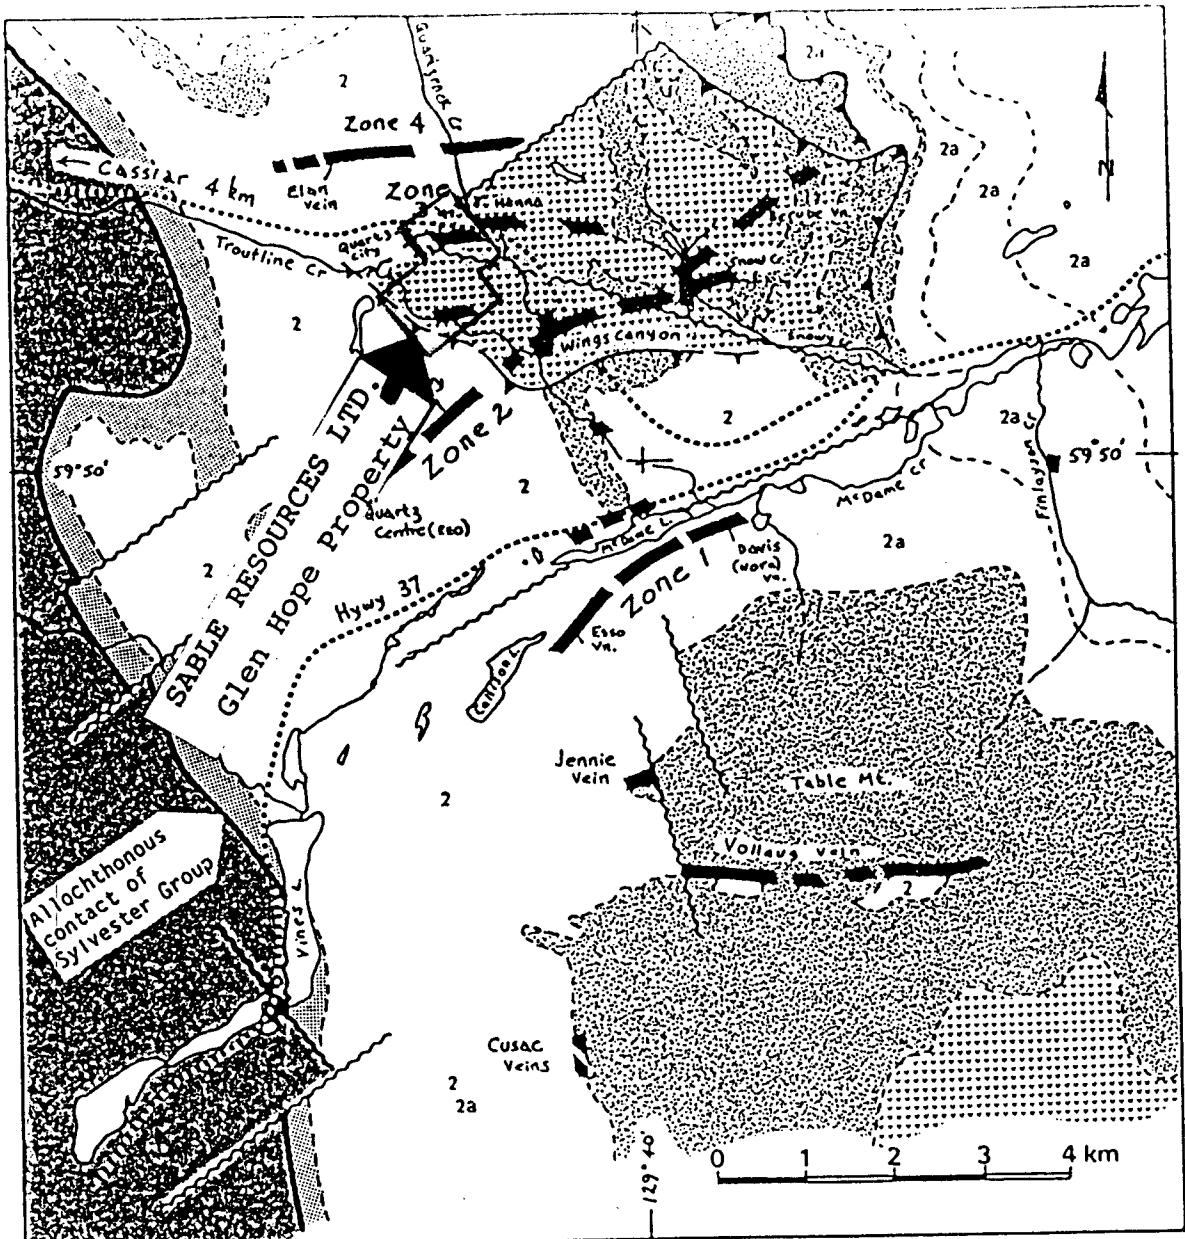

I, James Paxton, of the City of Richmond in the Province of British Columbia hereby certify as follows:

1. I am a graduate geologist with residence and office at 5086 Topaz Place, Richmond, British Columbia.
2. I am a Professional Engineer, registered with the Association of Professional Engineers of British Columbia.
3. I am a graduate of the University of Saskatchewan with a B.A. degree majoring in Mining Geology (1953).
4. I have practiced my profession as geologist for thirty years.
5. I have no interest, direct or indirect, in the claims or securities of Sable Resources Ltd., and I do not expect to receive any interest.
6. This report is based on my personal experience on the Glen Hope property during the summer of 1984.
