INTRODUCTION

The Golden Dragon, Golden, Dragon South and Margaret claims are located on the west side of Kootenay Lake between Cedar and Woodbury creeks. They range in elevation from 3500 to 6500 feet and are mostly heavily treed, with some logged areas. Access to the claims is by two wheel drive roads up Woodbury or Cedar creeks.

There is no known mineral production from the claims, although the Ainsworth Camp is well documented for its mineral production.

A total of 72 Geochem samples and 10 rock samples were analyzed.

Prospecting was done over a large area of the claims. Some work was done on all the claim groups.

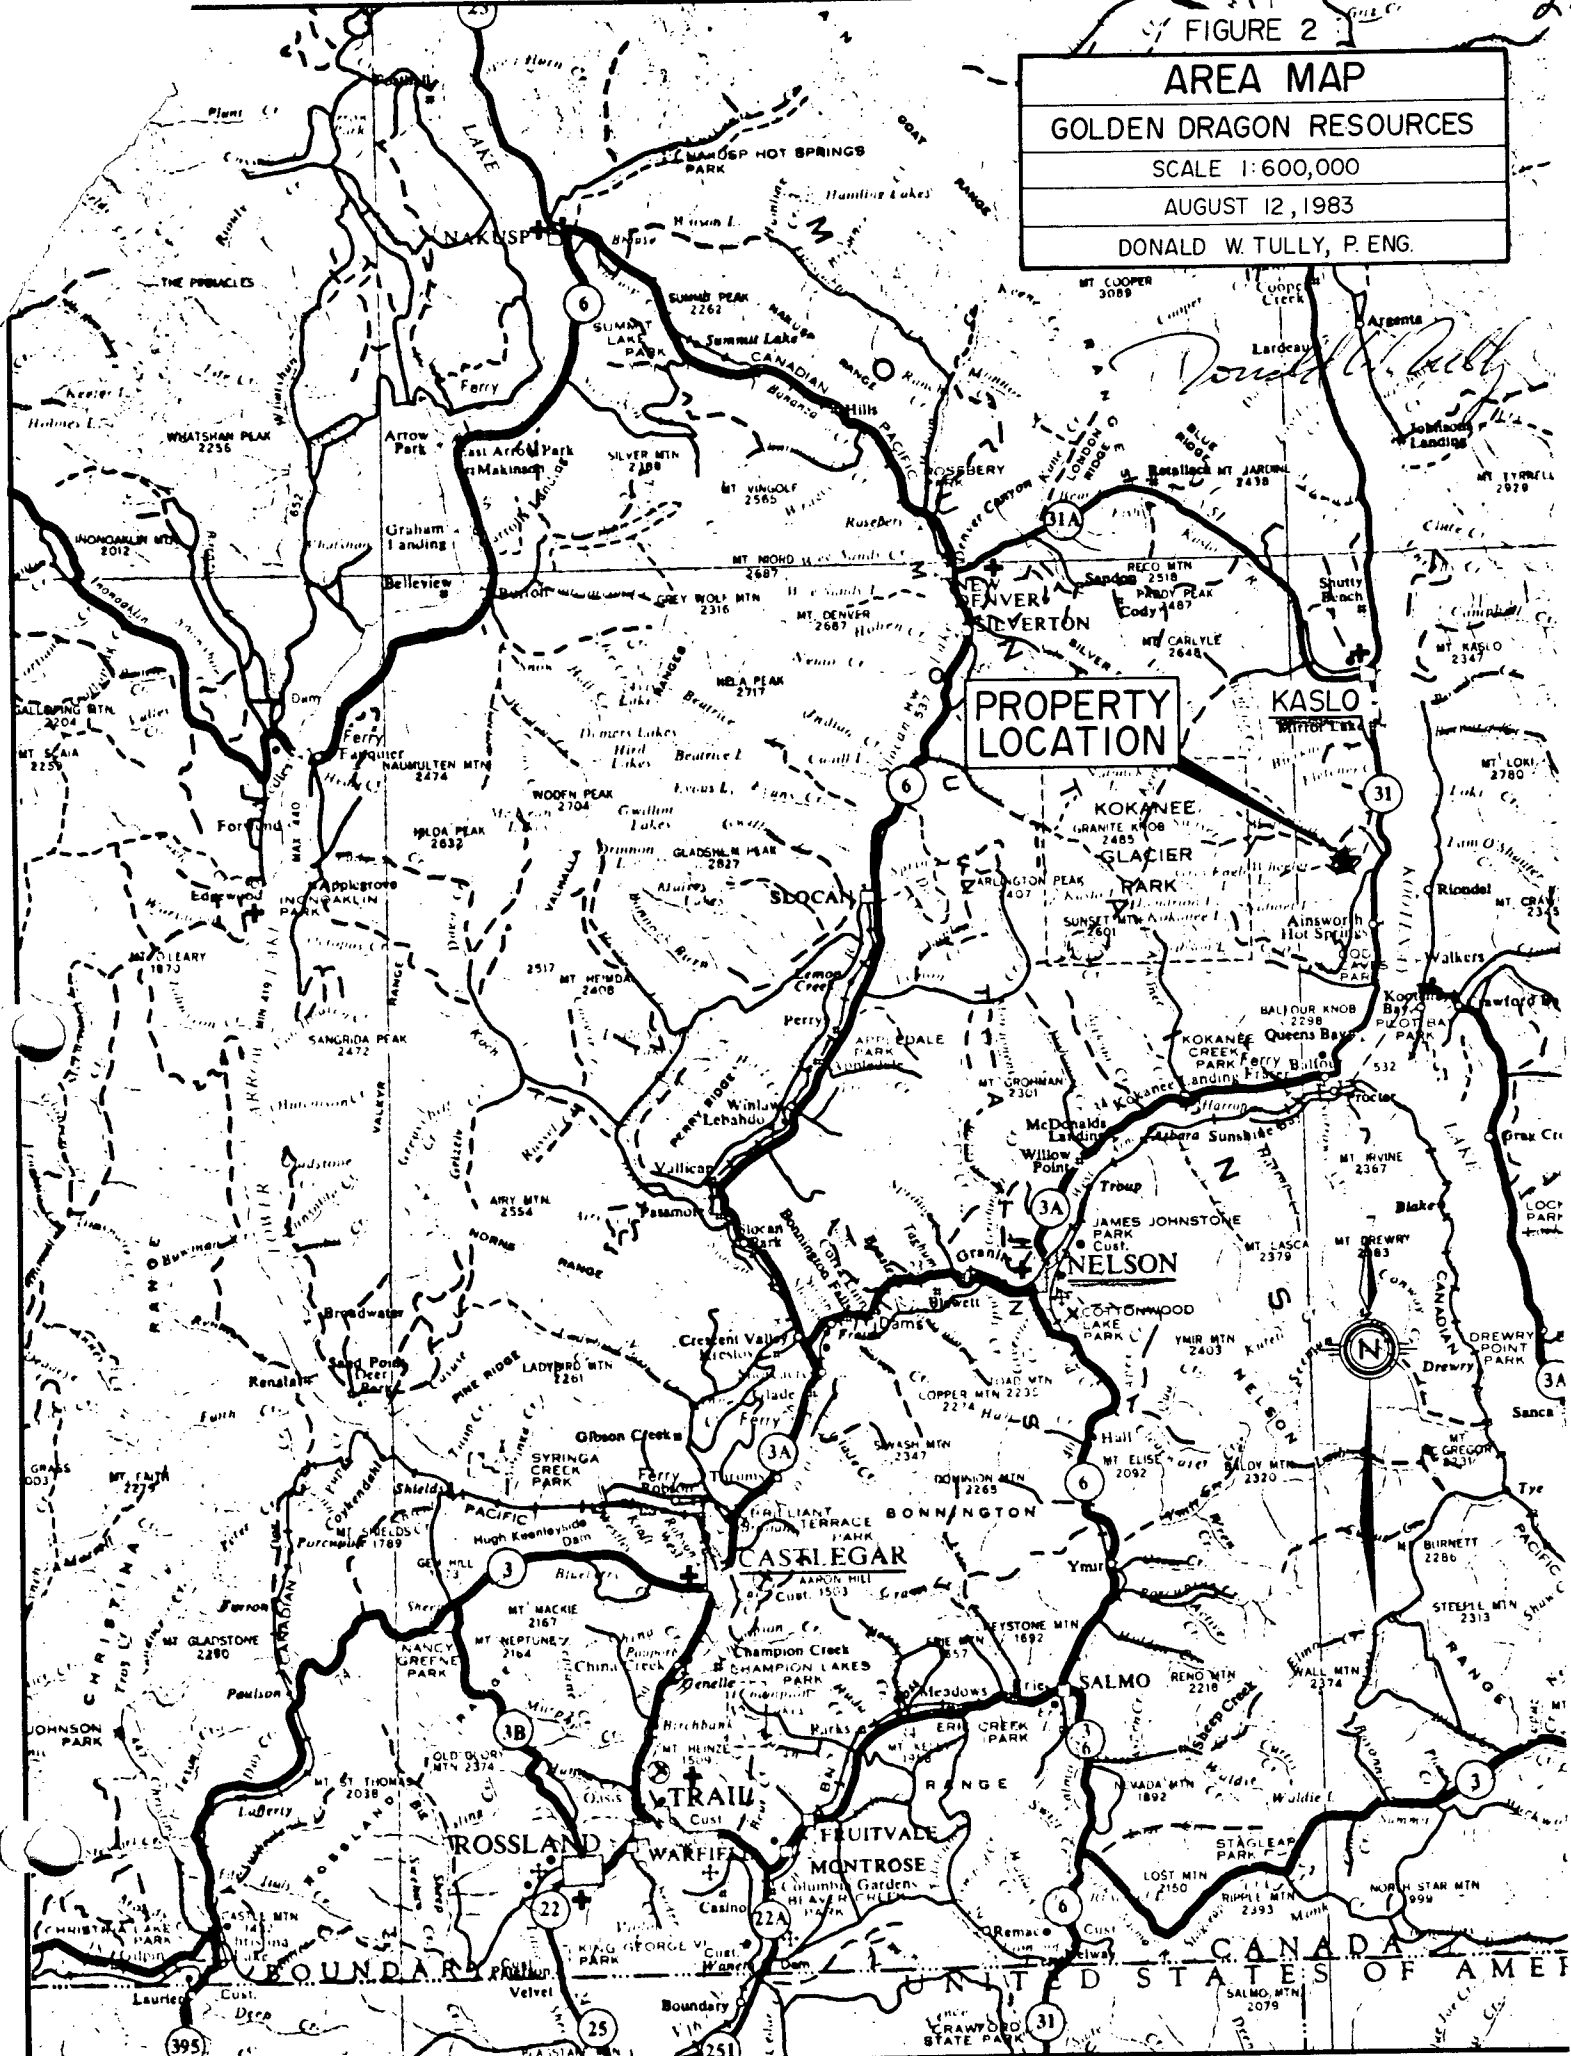

Road work clearing with John Deere "Cat" with backhoe and loader and one man with a chain saw from Woodbury Creek to Golden claim group

(3200 meters up from Woodbury Creek)

Road starts to the south past the first bridge over creek 5 miles from Kootenay Lake.

GEOLOGY

Tetrahedrite, with occasional grains of fine pyrite or marcasite, galena and sphalerite, were the sulphide minerals observed in the above samples.

The samples, taken at locations (2) and (4), are from vein structures that are probably parallel or sub-parallel to those vein structures in the underground workings in the mine area to the west.

The trenchings above the former underground working area are caved and do not appear to have exposed the surface bedrock.

The geological structure in the shales and calcareous slate horizon in the outcrops immediately east of the (lower) portal show a north-south-trending structure and dipping nearly vertical. Dragfolding was noted near sample location (4) and this structural feature may be a control for the emplacement of the quartz veins.

O. Riley and M. Linn, B.Sc., performed a reconnaissance geochemical survey, geological mapping and rock sampling during June and July, 1983, over the immediately east and north areas of the underground mine workings. The results of their work are shown on Figure 8 and in the APPENDIX to this report. Thirty-eight soil samples were analyzed. Four anomalous results for silver, eight anomalous results for lead, and one for copper, were obtained. Six rock samples were taken. One of these rock samples assayed 129.53 ounces of silver.

7.e.

Approximately 100 metres to the northeast of the (lower) portal at sample location (4), a similar white porcelaneous vein of quartz was found in situ, striking at 195° and dipping some 70° west across a width of some 60 cm (2 feet) at about the same elevation. The rock is a black argillite.

At elevation 4,600 feet, a zone of carbonate alteration in a greywacke sediment with a central quartz veinlet was exposed at sample location (2) across a width of about 6 cm. This vein, which is located about 65 metres east of the (lower) portal, strikes about 175° and dips vertically.

The assay results of the samples taken at the above-noted locations and shown on Figure 8, were as follows:

<u>Sample Location</u>	<u>Previous Sample Result</u>	<u>Sample Result by D.W. Tully</u>
(1)	-	0.003 ozs gold

CERTIFICATE

I, Michael Linn, of the Corporation of the Village of Kaslo, Province of British Columbia, hereby certify as follows;

1. I am a Consulting Geologist with an office on Arena Avenue, Kaslo, B. C.
2. I graduated with a degree of Bachelor of Science, Majors in Geology, from U. B. C. in 1970.
3. I have practiced my profession for 14 years.
4. This report is based on a personal examination of the claims during the past year.
5. DATED at Kaslo, Province of British Columbia, July 11, 1984.

Michael J. Linn
Geologist
