## SUMMARY

The Matheny I mineral claim consisting of 20 units, is situated on the west slopes of Mount Spearing in the Similkameen Mining Division, British Columbia, some 11 kilometers northwest of Tulameen, British Columbia.

Recently completed reconnaissance scale geological mapping has shown that the Matheny I mineral claim is underlain by volcanic rocks of the Nicola Group. Soils geochemistry has outlined anomalous areas in gold, copper, and zinc.

A program of detail soils geochemistry, geological mapping and sampling, and geophysical work consisting of magnetometer and VLF-EM surveys is recommended for the Matheny I mineral claim.

Respectfully submitted,  
Strato Geological Engineering Ltd.

Nigel J. Hulme, B.Sc.  
Geologist

## INTRODUCTION

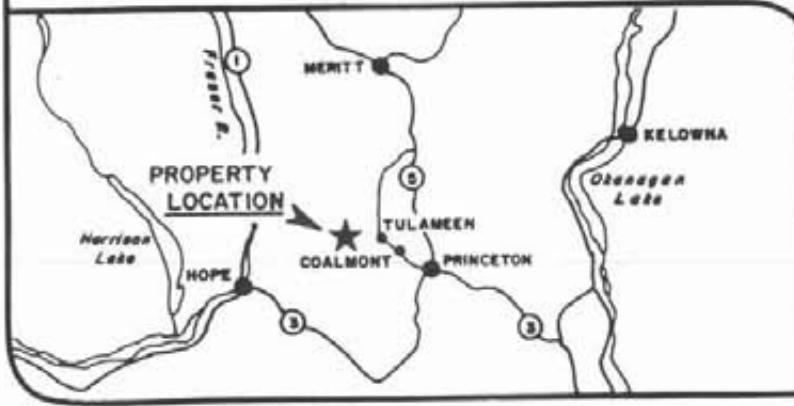

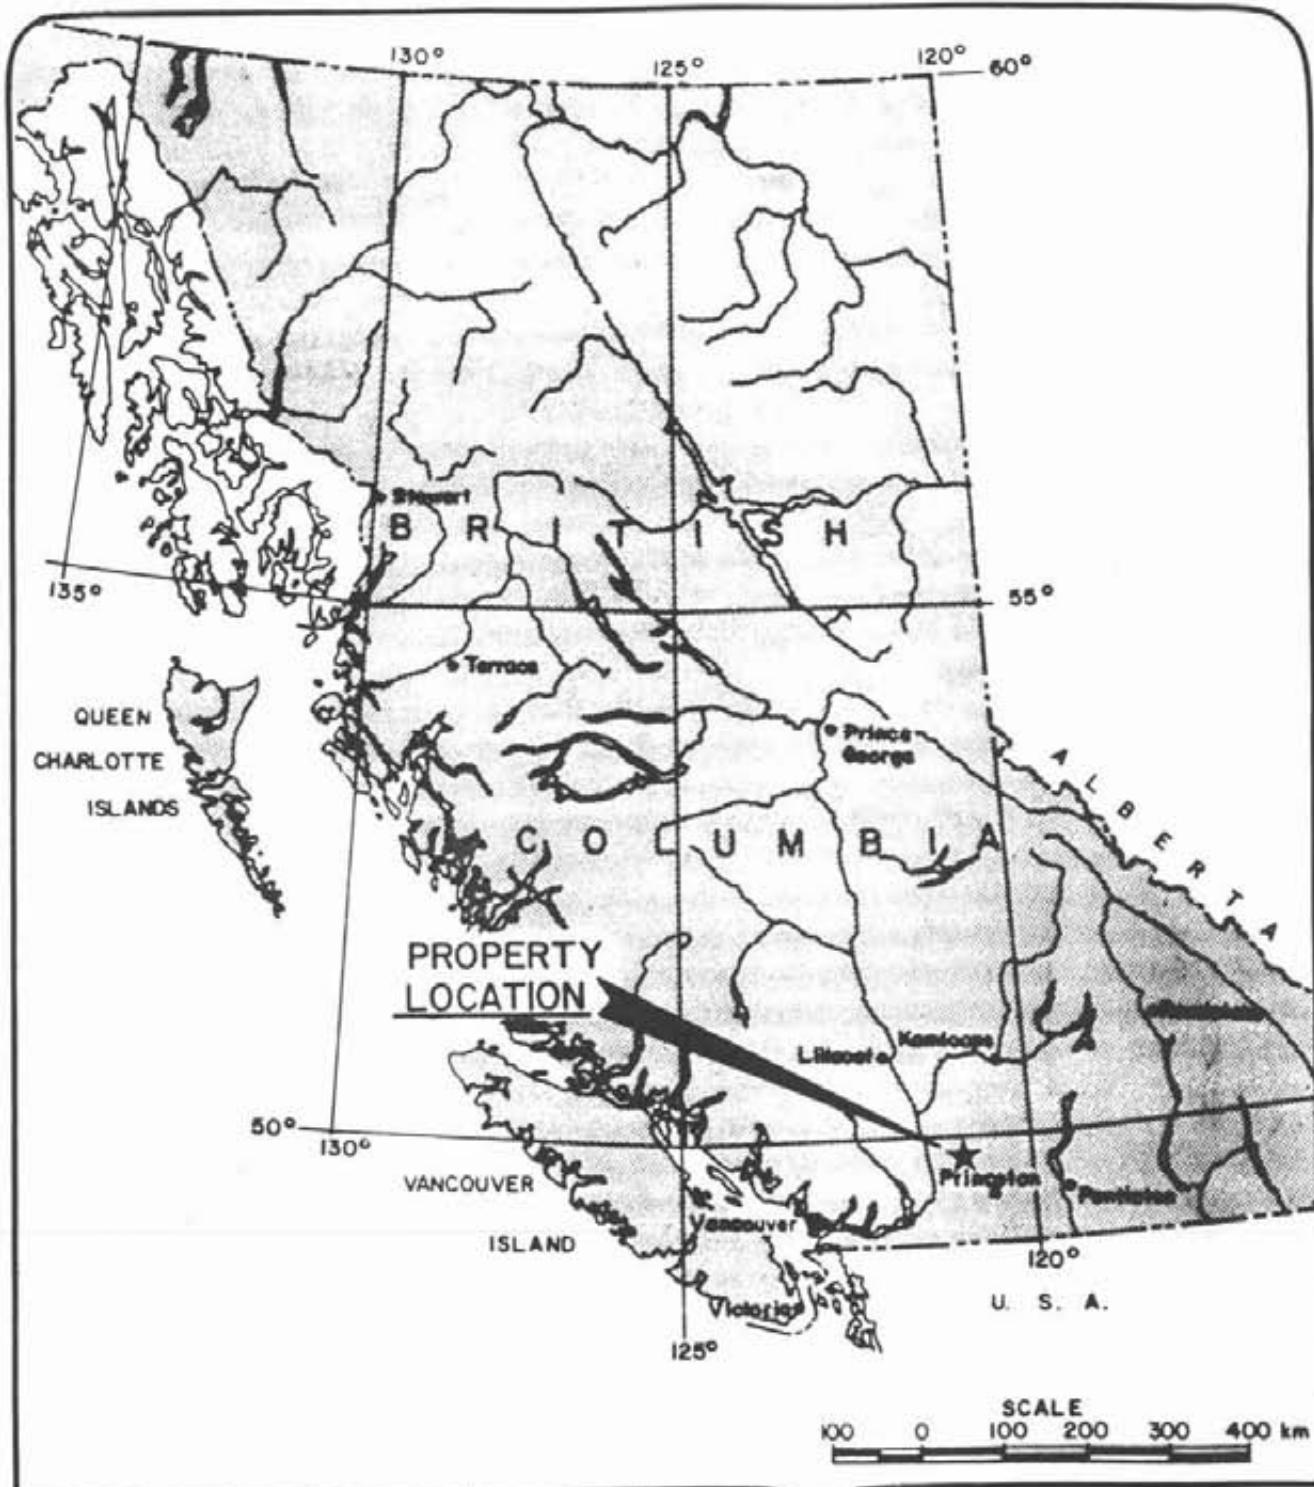

Pursuant to a request by Hank Leis, a preliminary exploration program was conducted over the Matheny I mineral claim, located approximately 11 kilometers northwest of Tulameen, British Columbia. Work consisting of reconnaissance scale geological mapping and geochemical prospecting was performed by Strato Geological Engineering Ltd. in August, 1984. The results of the survey work are presented in this report.

### LOCATION, ACCESS, TOPOGRAPHY

The Matheny I mineral claim is situated some 11 kilometers northwest of Tulameen, British Columbia (Figure 1). The claim is accessible by gravel road from Tulameen, a distance of 15 kilometers (Figure 2).

The claim lies on the western slopes of Mount Spearing; elevations range from 1130 meters above sea level at the Legal Corner Post to 1525 meters above sea level at the northwest corner of the property. Drainage is westwards to Lawless Creek.

CLAIMS

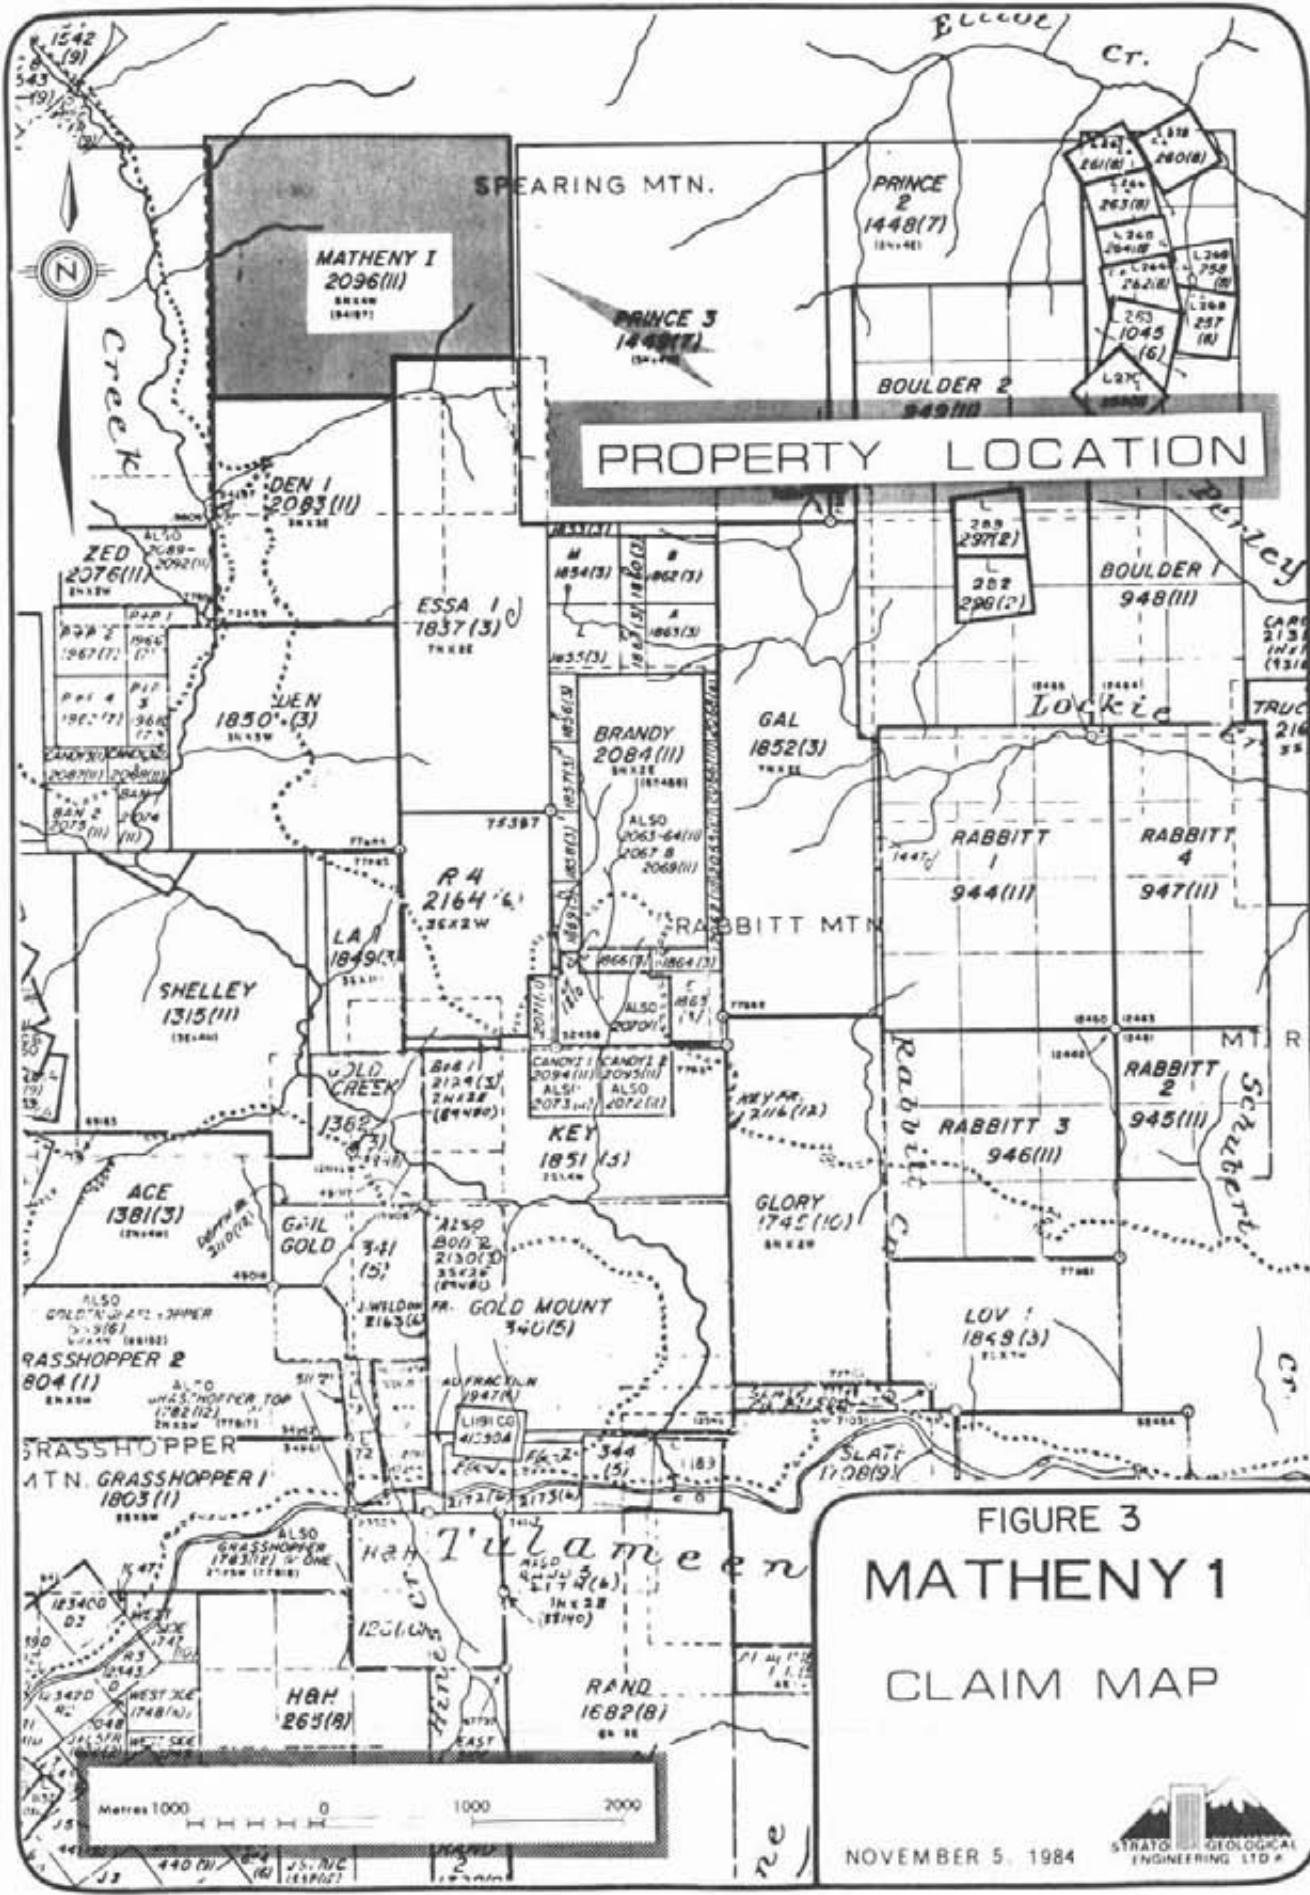

The Matheny I mineral claim is situate in the Similkameen Mining Division, approximately 11 kilometers northwest of Tulameen, British Columbia. The claim is recorded as follows:

NAME	UNITS	RECORD NO.	EXPIRY DATE
Matheny I	20	2096	November 23, 1984

Assessment work has been filed, this report being a part of the work to maintain the claims in good standing until November 23, 1987.

The claim is shown on British Columbia Ministry of Energy, Mines, and Petroleum Resources mineral claim map NTS 92H/10W.

The Matheny I mineral claim may not contain a full 20 units as it appears to overlap the Den I and Essa I mineral claims in the southern property area (Figure 3).

NOVEMBER 5, 1984

## HISTORY

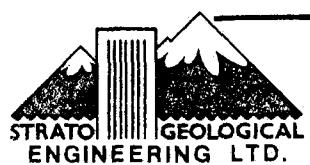

Mining development has occurred in the claim area on the former Bonanza Queen and Nevada crown grants, the Rabbitt Mine, the Old Glory Group and the Sunrise Camp.

Quartz veins with a general northerly strike and a steep dip occur in association with shear zones within Nicola Group volcanic rocks.

The veins, composed of glassy quartz and brecciated, carbonatized wall rock, vary in width from a few centimeters to 2 meters. The veins carry free gold, an undetermined telluride mineral, chalcopyrite, pyrite, galena, and sphalerite.

In 1983, Strato Geological Engineering Ltd. conducted an exploration program for Monica Resources Ltd. over the area surrounding the former Rabbitt Mine. A total of 146.2 meters of diamond drilling was drilled in three holes; the third hole intersected two vein structures assaying 0.232 oz/short ton and 1.645 oz/short ton over core lengths of 0.92 meters and 1.83 meters, respectively (Tully, 1983).

No known development has occurred on the ground covered by the Matheny I mineral claim.

## REGIONAL GEOLOGY

The Lawless Creek area is underlain by volcanic and subordinate sedimentary rocks of the Nicola Group, ultramafic to felsic rocks of the Lodestone Intrusions, intrusive phases of the Coast Intrusions (Eagle granodiorite), and intrusive phases of the Otter Intrusions (Red granite) (Rice, 1960).

The majority of the Nicola rocks in the area have not been closely identified and have been termed greenstones. Possibly andesitic in composition, they include lavas, flow breccias, pyroclastics, greywacke, and mixed pyroclastics and greywacke. Interbedded with the greenstones are bands of dacite, rhyolite, fine grained dark sediments, sedimentary schists, limestone, and minor conglomerate.

The Lodestone Intrusions include pyroxene syenite, pyroxenite, peridotite, dunite, diorite, gabbro, and feldspar porphyry. The intrusions occur as dykes and stocks in the southern Lawless Creek area and on the south slopes of Grasshopper Mountain.

**FIGURE 4**  
**MATHENY 1**  
**REGIONAL GEOLOGY**

0 4 mi

The Eagle granodiorite underlies a large area on the west slopes of Grasshopper Mountain. The principal minerals are quartz, feldspar, and biotite. The rock is slightly gneissic, coarse grained, and is mottled white and black.

A stock of red granite intrudes Nicola rocks in a hill east of Lawless Creek and south of Pioneer Creek. The rock is massive, medium grained, and consists of pink to red orthoclase, green saussurited plagioclase, quartz, and subordinate hornblende.

## PROPERTY GEOLOGY

The Matheny I mineral claim is underlain by Nicola Group volcanics consisting of andesitic flows and tuffs, and alkali feldspar trachytes. The rocks trend north-northwest and display variable dips.

### Andesite

Andesite flows and tuffs are present in the eastern and western areas of the property. The rocks are grey-green and weather to a buff-grey colour. Both porphyritic and aphanitic flows are present. Porphyritic rocks contain euhedral to subhedral phenocrysts of plagioclase feldspar up to 5mm long and euhedral phenocrysts of hornblende as large as 10mm. Some carbonatization and silicification has occurred; a sample (RM-1) of a slightly altered outcrop near the center of the claim assayed 7237 ppm copper, 13.7 ppm silver, and 75 ppb gold.

Tuffaceous volcanics are interbedded with flows in the eastern property area. Generally fine grained, they can contain plagioclase fragments varying from 3mm to 15mm in size.

### Alkali Feldspar Trachyte

Rocks of felsic composition outcrop in the east-central claim area and are postulated to lie in a band trending north-northwesterly through the claim. The rocks display a pink fresh surface which weathers pinkish-brown and contain abundant phenocrysts of K-feldspar generally 2mm in size set in a pink, fine grained groundmass.

## GEOCHEMICAL RESULTS

A total of 21 silt samples and 18 soil samples were collected from the Matheny I mineral claim. The soil samples were collected at 15 to 20cm depths from the "B-horizon", which lay under an organic cover 2 to 3cm thick. Samples were analyzed for copper, lead, zinc, silver and arsenic by the Inductive Coupled Plasma (ICP) method and for gold by the Atomic Absorption (AA) method.

Although the number of samples collected is too small to warrant statistical analysis. it can be seen from the assay results (Appendix A) that some anomalous areas are present. Specifically, these are at the locals of Mat 11, (100 ppm Cu and 172 ppm Zn) Mat 34, (35 ppb Au) and Mat 33 (75 ppb Au).

## CONCLUSIONS AND RECOMMENDATIONS

The Matheny I mineral claim is underlain by volcanic rocks of the Nicola Group. Gold mineralization in the area is known to occur in quartz veins associated with shear zones within Nicola Group volcanics. Soils geochemistry has outlined anomalous areas in copper, zinc, and gold.

It is recommended that soils geochemical sampling be conducted over the Matheny I mineral claim on a maximum of 100 x 100 meter grid basis. Detailed geological mapping and sampling may be conducted over the same grid. Geophysical work consisting of magnetometer and very low frequency electromagnetic surveys may be utilized in distinguishing geological contacts and/or shear zones with which mineralization may be associated. Relationships between the geology and the geochemical and geophysical results should then outline any targets of good mineral potential.

Respectfully submitted,

CERTIFICATE

I, NIGEL J. HULME, of the City of Vancouver, Province of British Columbia, hereby certify as follows:

1. I am a Consulting Geologist with offices at 3566 King George Highway, Surrey, B. C., Canada.
2. I graduated with a degree of Bachelor of Science, Geology, from Carleton University, Ottawa, Ont. in 1982.
3. I have worked as a Geological Assistant each summer from May 1980 with the Ontario Geological Survey, Gold Fields Mining Corporation, and St. Joe Canada Incorporated.
4. I have worked as a Geologist in Canada since December 1982.
5. I have no direct, indirect, or contingent interest in the Matheny 1 mineral claim, nor do I expect to receive any such interest.

Dated at Vancouver, Province of British Columbia, this  
5 th day of November, 1984.

N. J. Hulme, B.Sc.

## TIME-COST DISTRIBUTION

Soil sampling, silt sampling and geology were conducted over the Matheny 1 Mineral Claim, Record No. 2096 (20) Tulameen, B. C. by Strato Geological Engineering Ltd. during the period July 24 to August 4, 1984.

A list of personnel and distribution of costs are as follows:

### Personnel

J. Gibson	Project Supervisor
N. Hulme, B.Sc.	Geologist

### Cost Distribution

Field Work	\$ 2,212.50
Room and Board, Transportation	1,342.50
