PLACER DEVELOPMENT LIMITS

LOCATION MAP

V-194 GOOD HOPE

1. Introduction:

Placer Development carried out a program of grid construction and soil geochemistry on the Good Hope, Horsefly-Terrier and Canty groups of Crown Grants and the Sunset Crown Grant plus the York group of staked claims, in the Osoyoos mining division, during the 1984 field season.

The field work was carried out from June through October, 1984.

The ground is currently held under option from Good Hope Resources Ltd.

2. Summary:

Grid construction consisted of 14.8 kilometers of baseline and 183.4 kilometers of sidelines. Soil samples were collected at 40 meter intervals on the sideline.

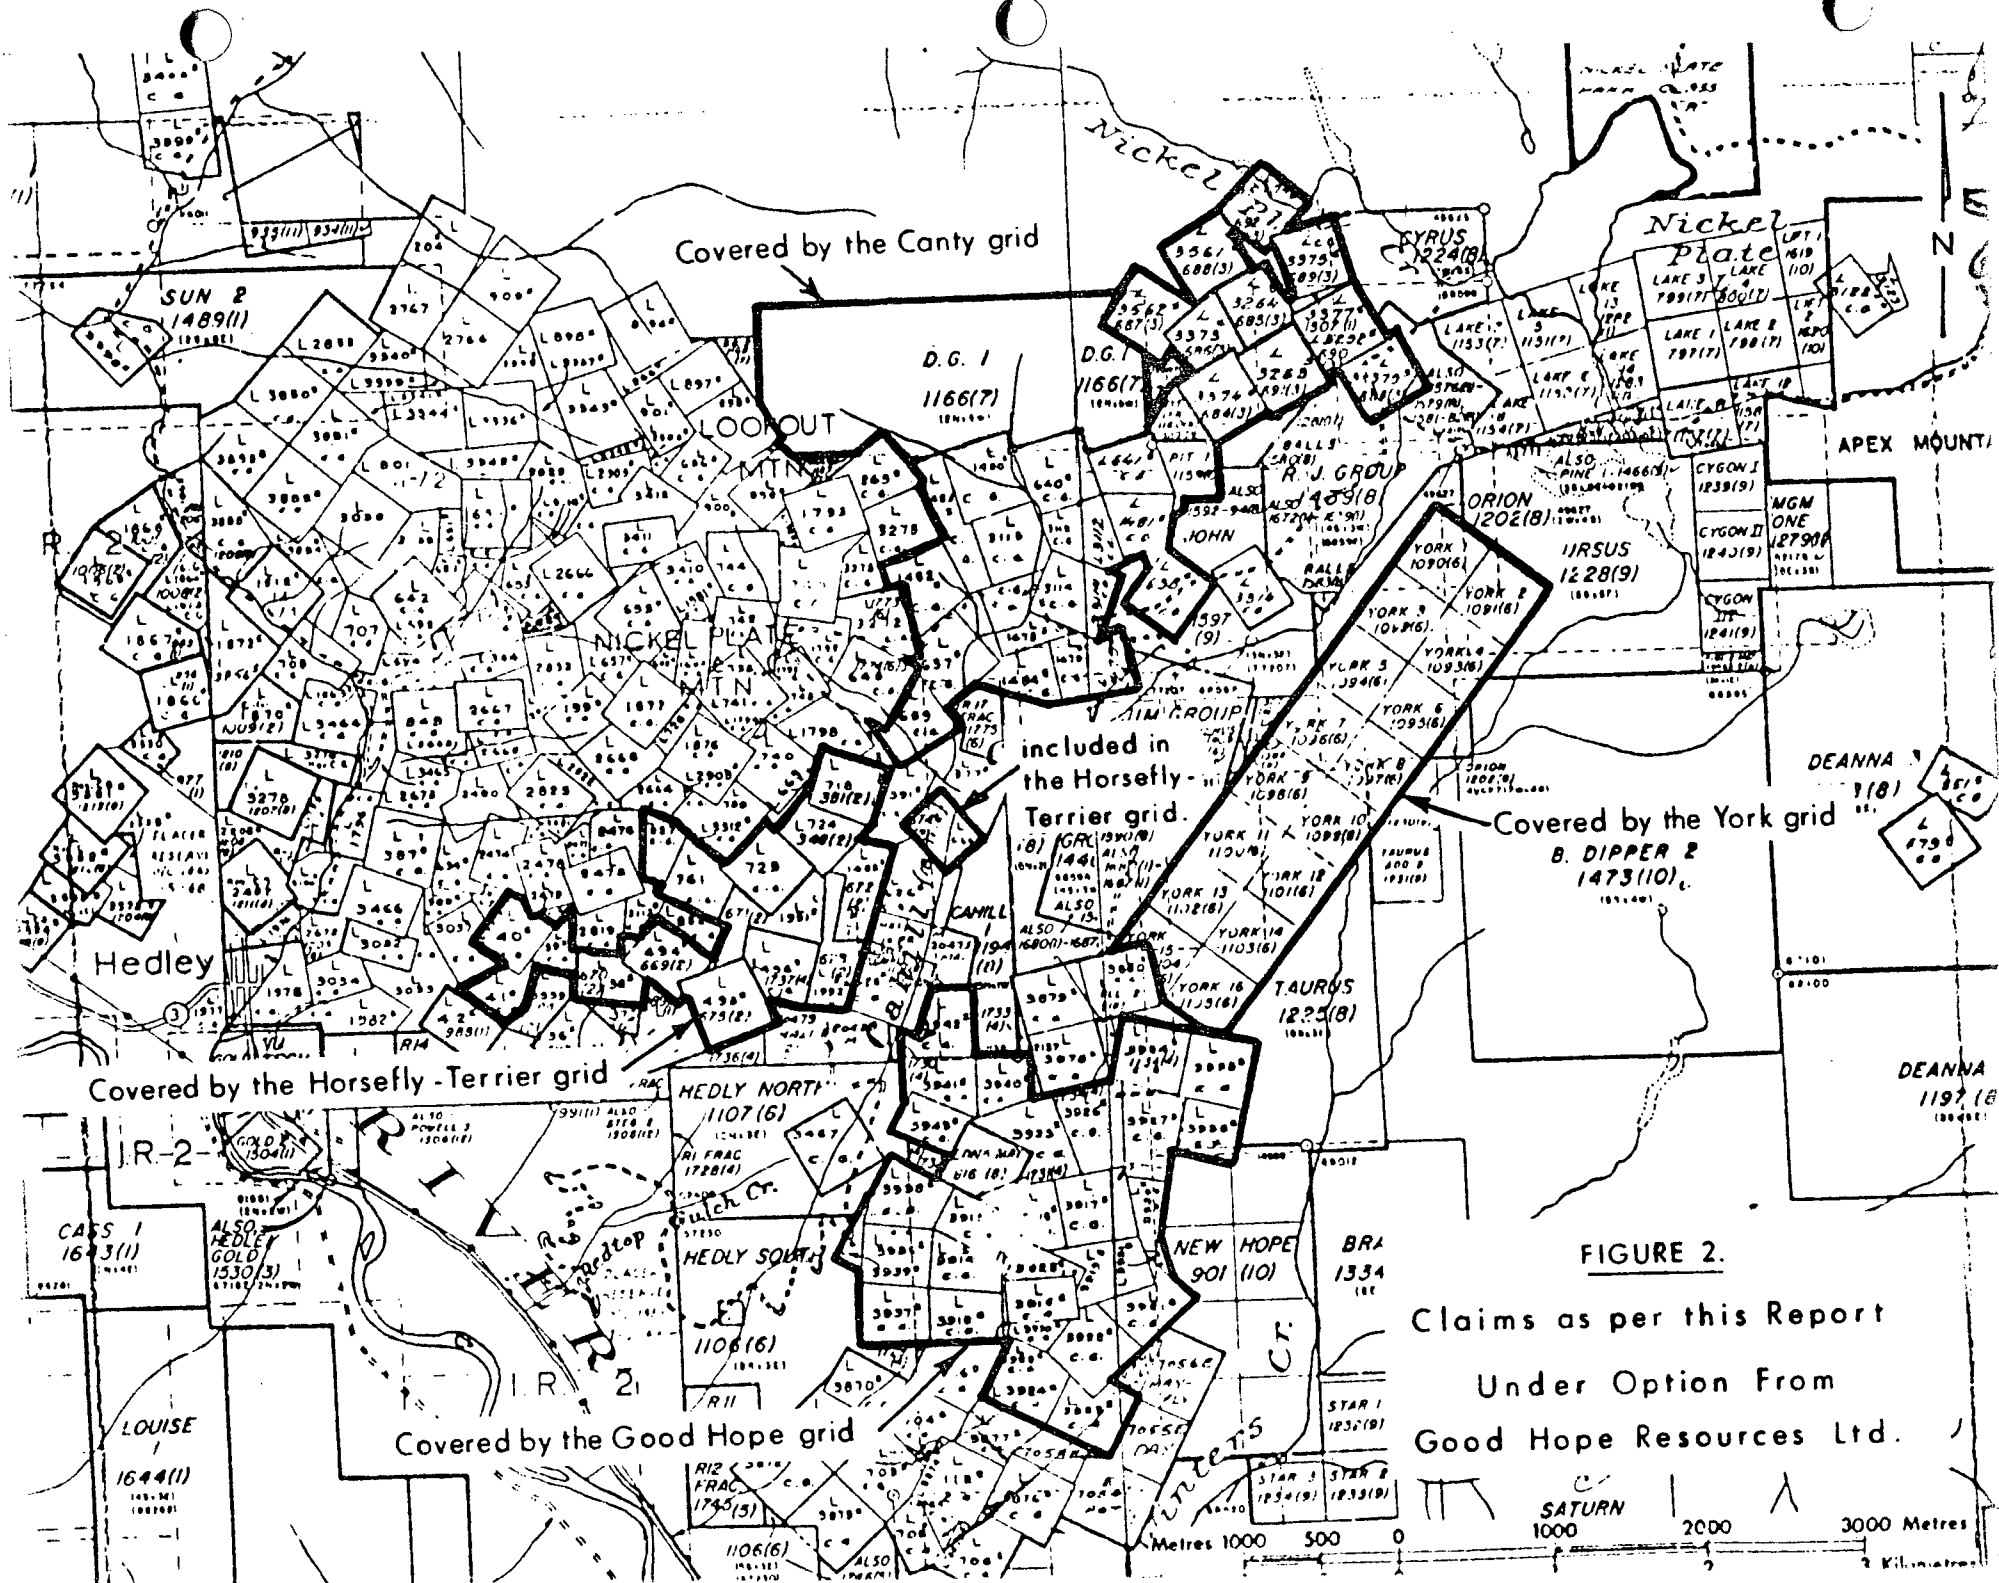

All soil samples were analysed for Au, As, and Cu. All except for some fill in samples were analysed for Mo.

A portion was analysed for Bi. Most not analysed for Bi were analysed for Co. A portion was analysed for Sb. A fraction was analysed for Ag.

A total of 4825 samples were collected and analysed.

3. Property Definition:

The claims under option are located to the easterly from Hedley, B.C. and are not all contiguous. The geographical "center" around which the various groups are located lies

Covered by the Cauty grid

Covered by the York grid

Covered by the Horsefly - Terrier grid

Covered by the Good Hope grid

FIGURE 2.

Claims as per this Report
Under Option From
Good Hope Resources Ltd.

approximately 5 km northeasterly from Hedley. A copy of a portion of the claim map for the area showing the properties is shown on Fig. 2 and a listing of the claims is given below.

Note: All mineral claims, reverted crown grants & crown grants are held by Good Hope Resources.

4. Topography Cover and Access

Topography varies considerably over the various claim groups. Those lying westerly from Nickle Plate Mountain cover, in part, precipitous terrain with numerous cliffs, bluffs, talus slopes and steep sidehills. The balance of the area is moderately rugged but "rolling" with occasional steep terrain.

Most of the area is forested. Tree species present are largely fir and pine. Some spruce is present in wetter areas and minor aspen is scattered over much of the "more open forest." Patches of grasslands are present on southerly and southeasterly facing slopes.

Access is very good. A good gravel road leads into the area from the Apex Alpine Ski Resort area which in turn is accessible via a good paved/gravel road from either Penticton or from a

point approximately 6 to 7 km east of Olalla on highway 3A. Alternatively a narrow, heavily switchbacked but good gravel road leads into the area from a point approximately 9 km east of Hedley on highway 3A.

5. Economic Assessment

The ground contains two former small tonnage producers, the Good Hope and Canty Mines. Also present are several small showings on the Horsefly-Terrier grid area. The Old Nickle Plate, Sunnyside(s) and Bulldog Zone which were all former producers and which are currently being investigated by Mascot Mines with some success, lies to the north and west of much of the area of the Good Hope option. Another small producer the French Mine lies just to the south of the Good Hope Mine area.

The ground under option, therefore, must be considered to possess considerable potential for containing economic mineral deposits.

6. Geology

6.1 Note on Regional Geology

The area is underlain by the Nicola Sedimentary-volcanic complex of Triassic age. This complex has been folded into a regional anticline whose axis strikes about 15 degrees east of north and lying on, or possibly just to the east of Winter's ridge. The west limb dips 20 to 30 degrees northwesterly and the eastern limb is close to vertical. Numerous smaller structures are superimposed on the regional structure. Northeasterly trending regional faults are important.

Examples of these occur along Bradshaw (20 Mile), Winters and probably, Cahill Creeks. Some large northwesterly trending faults are also present.

Batholithic bodies, dioritic to granodioritic in composition essentially surround the Nicola rocks on a regional basis. Numerous sills, dykes and small stocks mostly from gabbroic to dioritic in composition intrude the Nicola rocks. Some of these are important with respect to economic mineralization.

Economic mineralization, as known to date, occurs in structures, mostly folds, within skarn zones in the vicinity of one or more intrusive bodies. Gold is associated with arsenopyrite and/or Au-Bi Tellurides. Sometimes it is associated with pyrrhotite particularly when chalcopyrite is present.

6.2 Note on Property Geology

Rocks similar, at least in part, to these hosting known mineralization underly much of the optioned area. Structures that, given the right condition, could host mineralization are present in a number of localities. Similar alteration can also be found in a number of places but not in similar quantities. Au bearing mineralization is also present in a number of localities besides the Good Hope and Canty mines but to date, only in small occurrences and/or in very low concentrations.

7. Work Done

7.1 Grid Construction

14.8 kilometers of baseline and 183.4 kilometers of sideline were constructed. The work was done under contract to Placer Development Ltd. by Mr. Leo Reichert of Keremeos. All line and distance were established using Silva compasses and "hip" chains. The baselines were cut out. Sidelines were sparsely blazed with only occasional cutting out in the denser brush. Stations were marked using white shipping tags attached to the station with orange or pink plastic flagging. The station

identification was marked on the tags with waterproof black felt markers. Lines were set at 100 meters apart and stations along lines are at 20 meter intervals. Minor fill in work was done producing a small amount of 50 meter line spacing. A plan of the grid relative to the claims and some landmarks is shown in Figure 3.

7.2 Geochemical Soil Survey

7.2.1 Soil Development and Sampling

An attempt was made to sample the B Horizon throughout the work. In a few minor instances swampy areas prevented the collection of samples or produced samples of reduced quality. The B horizon is moderately to well developed over practically all of the surveyed area and is very easy to identify. *Depth is variable*

Samples were collected at 40 meter intervals on all lines from 100N to 182N. Minor fill in work was done in the Good Hope and York grid areas.

In all approximately 4,825 samples were collected and analyzed.

All samples were analysed for Au, As, and Cu. All except the fill in samples were analysed for Mo. Bi was analysed for in a portion of the samples and most of those not analysed for Bi were analysed for Co. Sb was analysed for in a portion of the samples. Ag was analysed for in only a fraction of the samples.

7.2.2 Results

All results obtained are listed in Appendix II. All values obtained for Au, As, Cu, Mo, Ag and Co are displayed on the accompanying plans.

No plans have been prepared for Bi and Sb because of the paucity of samples at or above detection limit. Results may be observed on the listing of results in Appendix II.

(i) Gold Figure 9, 1:10:000

Values range from below detection limit to 8.3 ppm. The gold geochemistry is dominated by the large anomaly occupying a large part of the northern half of the Horsefly Terrier grid.

Apart from this anomaly the Au geochemistry shows only spot highs or small groupings of anomalous samples. One small grouping with a high value of 8.3 ppm is coincident with the Good Hope mine. A 3 sample low intensity grouping is coincident with the sub outcrop of the Canty mineralized zone.

(ii) Arsenic Figure 5, 10:000

Values range from below detection limit to 25,600 ppm. Problems in the analyses for As are evident on the accompanying plan. There are discrepancies between adjacent lines and between original and fill in work greater than would normally be expected. These problems are most evident in the lower values, i.e., 25 ppm or less.

Apart from the above the following may be observed:

The outstanding feature displayed on the plan is the intense arsenic response that encompasses a large portion of the Horsefly-Terrier grid.

The Good Hope and Canty mines are both readily identifiable in the As geochemistry.

A number of small anomalies are scattered over the grid, the "best" of which is centered at about 152.5N x 7800E on the York group.

(iii) Copper, Figure 4, 1:10,000

Values range from below to detection limit of 8700 ppm. The most noticeable feature displayed is the well defined Cu response present over much of the northern portion of the Horsefly-Terrier group. The Good Hope and Canty mines are only weakly identified in the Cu geochemistry.

(iv) Molybdenum, Figure 6, 1:10,000

Values range from below detection limit to 28 ppm. Only a few spot highs, most consisting of only 1 sample, are scattered over the grid.

(v) Cobalt, Figure 7, 1:10,000

Cobalt analyses were done for only a fraction of the samples collected, most of these being on the York portion of the grid.

Values range from 4 to 193 ppm. No obvious anomalies are present. The 193 ppm value is from a single sample surrounded by values in the order of 20 ppm.

(vi) Silver, Figure 8, 1:10,000

Only a small fraction of the samples collected were analysed for Ag. Of those analysed values range from below detection limit to 1.1 ppm. The higher values were obtained in till in sampling at one area of anomalous Cu response.

(vii) Antimony. No plan prepared

- Almost all samples were below detection limit. Of the 9 samples at, or above detection limit, the highest value was a mere 4 ppm. There is, practically, no association of these values with anomalous values for the other elements analysed for.

Results are contained in the history of geochemical results in Appendix II.

(viii) Bismuth. No plan prepared

Almost all samples were below detection limit in Bi. Only 11 of over 3000 samples analysed were at or above detection limit. Almost all of these above detection limit are also anomalous in at least 1 of Au, As and Cu, generally at least 2. Results are contained in the listing of geochemical results in Appendix II.

7.3 Interpretation of Results

7.3.1 Elemental Efficacy

Cu is probably the most reflective of bedrock variations of the elements analysed for. It is also the most reliable regarding analytical results of the elements for which we have complete coverage.

As is very diagnostic of soil/bedrock variations in the element but, particularly at lower concentrations, (in the order of 25 ppm or less) analytical results are sometimes not accurate or consistent, thus limiting its usefulness as an indicator of geology.

Au is demonstrably reflective of soil/bedrock concentration but not to the same extent as As. Also, because the absolute concentration of Au on a sample to sample basis is, for much of the sampled areas, below detection limit, the element is not reflective at the underlying soil variation or geology.

Mo is present above detection limit in a limited proportion of the samples thus it, again, will not reflect absolute variation in soil content and thus not reflect underlying geology.

Bi reported at or above detection for only eleven samples despite the fact that Bi is present in the known deposits. Thus it has very limited usefulness as an indicator of Au mineralization or as an aid to interpreting the geology.

Co appears to be reflective of soil content and possibly geology. However, it is not nearly as efficient as Cu and therefore not as useful. Also it has only partial coverage.

Sb reported slightly above detection limit in only a few samples. Thus it has a very limited utility as either an indicator of mineralization or as an aid to interpreting the geology.

Ag was analysed for only a limited number of samples. Response was low. Its efficiency in locating mineralization or in reflecting geology has not yet been determined.

7.3.2. Observations

The large intense anomaly on the Horsefly-Terrier grid is derived in large part from the skarn bowl and known mineralized area lying immediately to the north of this

grid. Major ice movement from the northwest and topography have contributed to the transport of this material to its present location. This will, at least, partially mask any response from mineralization contained in the rocks underlying the area.

Both the Canty and Good Hope mines are readily identifiable in the results. Thus, by intense similar response in other portions of the gridded area might reflect significant mineralization in the underlying bedrock. Such response exists in several locations however the best anomaly appears to be that located in the northern portion of the York grid.

8. Sample Preparation and Analytical Procedures:

All samples for this program were prepared and assayed by Placer Development Limited Geochemical Laboratory at Vancouver, B.C.

8.1 Analysis for Cu, Mo, As, Ag, Co and Bi

All samples are dried in a hot-air dryer. The soil samples are then sifted in -80 mesh nylon sieves.

Following the drying and sieving process, a 0.50 gm portion of -80 mesh fraction of soil is weighed with a precision torsion balance. Samples are digested in hot solution of HNO_3 and HClO_4 for four hours, then cooled, diluted and prepared for analysis on Perkin-Elmer 603 Atomic Absorption Spectrophotometer for Cu, Mo, As, As.

Detection limits and ranges are listed below:

<u>Metal</u>	<u>Detection Limited and Range</u>
Copper	2-4,000 ppm
Molybdenum	1-1,000 ppm
Arsenic	2-1,000 ppm
Cobalt	2-2,000 ppm
Silver	0.2-20 ppm
Bismuth	2-2000 ppm

8.2 Analysis for Au

Following the drying and sieving process, a 10.0 gm portion of -80 mesh fraction of soil talus-fine or conventional sediment or -150 mesh fraction of the bulk sediments or rock is mixed with aqua regia and heated at 600 degrees Celsius for three hours, then HBr solution is added and allowed to stand overnight. Water and MIBr solution are added, shaken, centrifuged and then 1% HBr in water is added to the top organic layer separate. Solution is shaken prior to analysis for Au by atomic absorption. Detection limit and range are 0.02 to 4.00 ppm.

8.3 Analysis for Sb

The process is identical to that described in 8:1 up to the point of digestion. Digestion of sample is by HCl/HNO_3 at 80°C for two hours. Beyond that the process is again, essentially, identical to that outlined in 8:1.

Detection limit and range is 2 to 1000 ppm.

9. Statement of Expenses

Sample preparation and analysis all for Au, As, Cu and Mo, partial for Bi, Co, Sb and Ag.

	TOTAL:	105,942.25

10. Conclusion

The geochemical work done over the gridded area demonstrates that potential exists for the discovery of significant mineralization in much of the bedrock underlying the various groups of Crown Granted and staked claims.

Follow up investigation of a number of areas is warranted.

APPENDIX 1

STATEMENT OF QUALIFICATIONS

I, Robert J. Young of Placer Development Limited do hereby certify that:

1. I am a Geological Engineer.
2. I am a graduate of the University of British Columbia with a B.C. Sc. in Geological Engineering 1962.
3. I am a member, in good standing at the Association of Professional Engineers of British Columbia.
4. From 1957 until the present, I have been engaged in exploration and mining geology (open pit and underground) in British Columbia and in Chile, S.A.
5. I personally supervised and participated in the field work and have compiled, reviewed and assessed the data resulting from the work.
