SUMMARY

Detailed grid geochemical, magnetometer and VLF-EM surveying were completed on two geochemical anomalies located in the 1983 field season on the Silvercup 2 claim. The program has been successful in delineating a silver-copper-molybdenum anomaly striking north-northeast, about 800 metres long and open to the south where it extends onto the May 1 claim. Coincident elevated levels of arsenic, antimony and fluorine indicate the possibility of epithermal precious metal mineralization perhaps of a similar nature or genesis to the significant gold mineralization (in Tertiary quartz porphyry) discovered during drilling on the YP claims to the north in 1983. No further encouragement was obtained on the second regional anomaly perhaps because of depth of overburden.

## INTRODUCTION

The work described in this report includes detailed geological, geochemical and geophysical examination of two anomalies ("A" and "B") located by reconnaissance exploration of the Silvercup and adjoining claims in 1983 (Medford and Christopher, 1983). Potential targets on this property include Pb-Zn-Ag mineralization such as found on Regional Resources' Midway property to the east and the Marbaco camp to the west. In 1983, Butler Mountain Minerals Corp., drilling several kilometers to the north on the YP claims in the Yukon, delineated significant gold intersections associated with a quartz porphyry of Tertiary age as well as Pb-Zn-Ag mineralization. The possibility of epithermal precious metal mineralization or that associated with young intrusives provides additional exploration potential in this area.

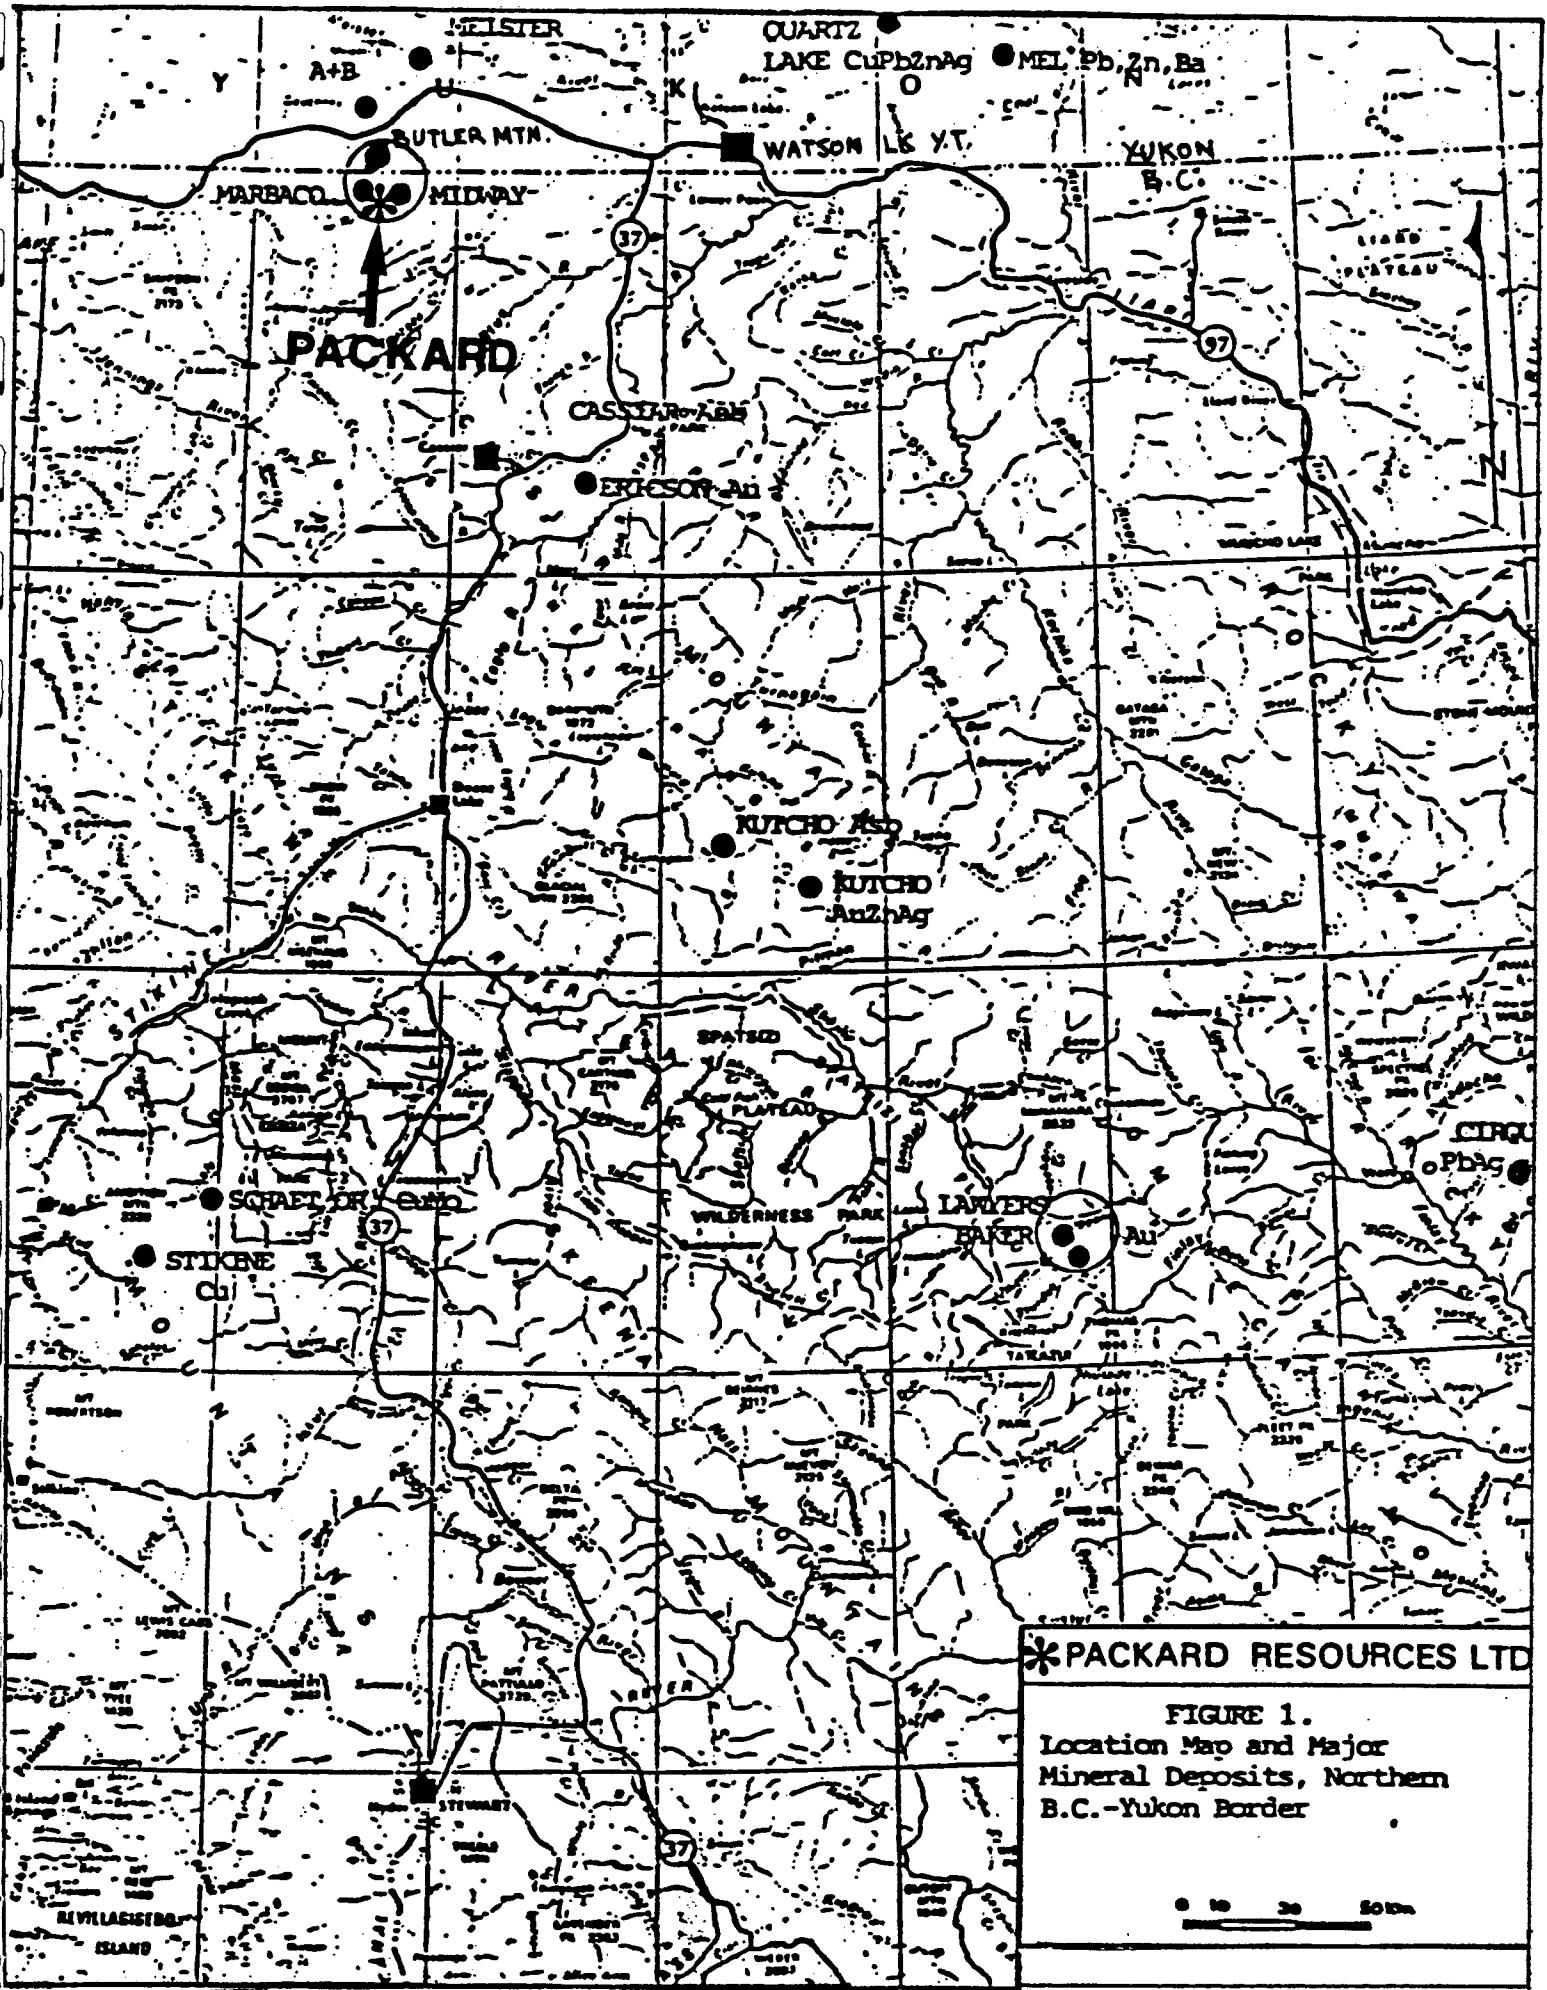

## LOCATION AND ACCESS

The claims straddle the Tootsee River in British Columbia approximately 15 km south of Rancheria, Y.T. and 100 km west of Watson Lake (Figure 1). Access to the property is gained from the Alaska Highway at mile 701, following the road to Regional Resources' property. Extensive road reconstruction work on this route was in progress in June 1984. The Rancheria River must be forded at mile 701 but in times of high water, a bridge at Freer Creek, mile 706, can be used.

Helicopters are available at Watson Lake for winter access and at Rancheria in the summer season. Watson Lake is serviced by CP Air from Vancouver.

## WORK PROGRAM

Detailed grids were set out on anomalies "A" and "B" located in 1983. Linespacings of 100 m were used with a 30 m sampling interval. Soils from grid "A" were analyzed for Cu, Pb, Zn and Ag and those from grid "B" for Mo, Cu, Pb, Zn and Ag. A total of 709 soils and a few silts were collected. A baseline was cleared over a length of 1.6 km to provide easier access on anomaly "B".

\*PACKARD RESOURCES LTD

FIGURE 1.  
Location Map and Major  
Mineral Deposits, Northern  
B.C.-Yukon Border

0 10 20 30 40 km

VLF-EM surveying using stations Cutler and Hawaii was undertaken over 7.44 line-km crosslines of grid "B" and 2.04 line-km on grid "A". Magnetometer surveying was also completed on grid "B" over 9.93 line-km.

Mapping and prospecting was completed on grid "B" and geological observations were made while soil sampling on anomaly "A".

### CLAIMS

The claims forming part of the Silver group are listed below:

	<u>Record Number</u>	<u>Units</u>	<u>Expiry Date</u>
Silvercup 1	2801(6)	12	June 1987
Silvercup 2	2802(6)	16	June 1987
Silverspoon 1	2803(6)	12	June 1987
Silverspoon 2	2804(6)	16	June 1987
Jane	2805(6)	2	June 1987
May 1	2808(6)	18	June 1987
May 2	2809(6)	18	June 1987
Jane Fr.	2806(6)	1	June 1987
Spoon Fr.	2810(6)	1	June 1987
Silver Fr.	2811(6)	1	June 1987
Suey Fr.	2943(9)	<u>1</u> 98	<sup>Oct</sup> June 1987

The claims are plotted in Figure 2 as rendered by Amex Exploration Services Ltd., Kamloops, B.C. which did the staking.

### REGIONAL AND LOCAL GEOLOGY

The area of interest is situated on the east flank of the Cassiar batholith which extends over 300 m from the Wolfe Lake map sheet in the Yukon southeast to the

1 : 50,000.

Kechika map area in British Columbia. The geology in the vicinity of the property is shown in Figure 3 after McIntyre (1982).

The units underlying anomaly "A" appear to be the eastward extension of the those hosting the Marbaco deposit and include a shale (slate) - limestone - phyllite package. Those hosting anomaly "B" are higher in the section and include carbonaceous platy siltstones, interbedded with carbonaceous and calcareous quartzites. These units overlie green to silver phyllites and probably are part of the uppermost Kechika Group of middle (?) Silurian age.

A description of significant mineral deposits in the area is given in Medford and Christopher (1983). The metallogeny includes silver, lead, zinc, tin, tungsten and molybdenum as well as a recent (1983) discovery of gold on the YP claims to the north.

### GEOCHEMICAL EXAMINATION OF THE DETAILED GRIDS

#### Grid "A" (Map 6 and 7)

Grid "A" (Figure 4) was established to cover a few anomalous silver values (2.4 - 4.4 ppm) obtained on a reconnaissance soil line in 1983. As these anomalous soils overlie the limestone unit that appears to be the eastward extension of that hosting the Marbaco vein deposit, a more detailed examination of this area was warranted.

A base line 650 m long trending 106° was laid out with orthogonal crosslines 420 m to the north and 600 m to the south. Soil samples taken from the B horizon were analyzed for Cu, Pb, Zn and Ag at Chemex Laboratories (Appendix 2). The results are posted on Maps 6 and 7.

#### Results

Attempts were made to contour the results presented on Map 7 without success. No definitive anomalous trends could be discerned. Silver values are generally elevated relative to most of the property but there is no focus of high values that warrants follow-up.

The glacial overburden is probably too thick for satisfactory geochemical exploration at this location and the silver geochemistry may be influenced by surface run-off from higher ground to the west. To this effect, it is noted that the silver analyses reported in soils just east of this area on the other side of the Tootsee River are almost uniformly 0.1 ppm. This survey is thus not considered an adequate test of the limestone horizon below.

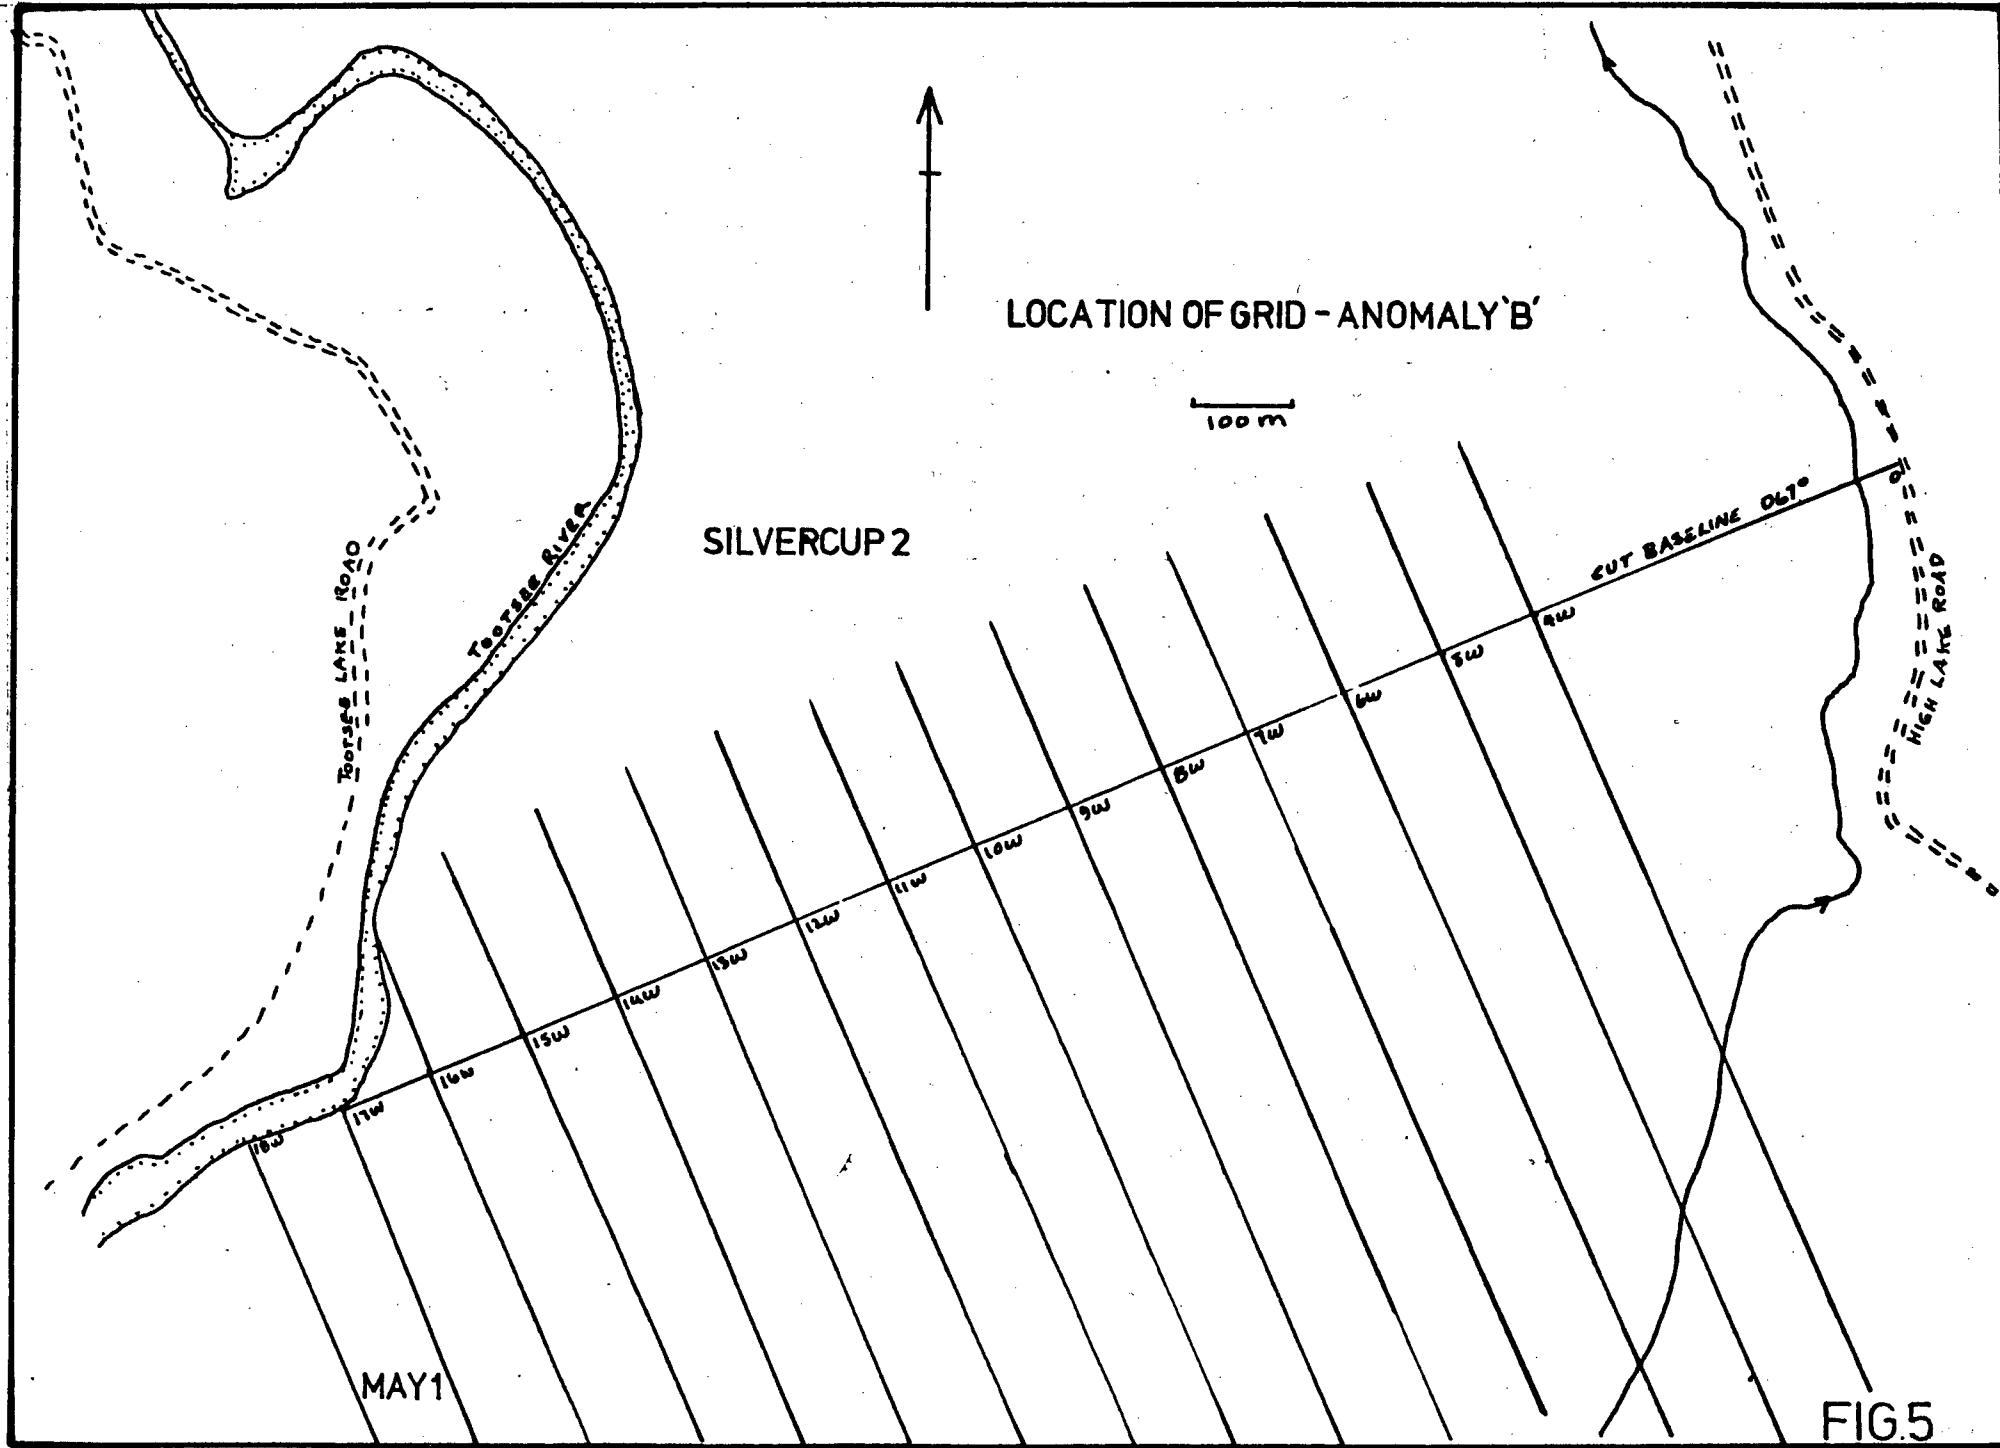

#### Grid "B" (Map 1 and 2)

A 1.7 km baseline terminating at the Tootsee River on the west side (Figure 5) was cut and cleared. Crosslines approximately 1 km to the south were established to cover a Mo, Ag anomaly detected on two soil lines during exploration work in 1983 (Medford and Christopher, 1983). A geochemical orientation study carried out prior to the 1984 field season (using samples collected in 1983) indicated that the Mo, Ag anomaly was also characterized by elevated Sb, F, and As (see Appendix 3). This suite, characteristic of epithermal precious metal deposits, and Butler Mountain Minerals Corp.'s discovery of gold mineralization in a Tertiary quartz porphyry several kilometers to the north on the YP claims dictated that the anomaly be more fully evaluated.

An attempt was made to sample the B horizon if possible. This horizon was found to be poorly developed in most places and often frozen because of the north facing slope. Frequently rock chips were excavated along with the soil hence indicating that some sampling was done in the C-horizon. Analyses are presented in Appendix 2.

#### Results

Molybdenum values contoured at 10, 20 and 30 ppm (Map 2) produce a strong anomaly in excess of 800 metres long striking in a north-northeasterly direction. Silver values on the grid are well above the 0.1 ppm level reported by most of the property and the highest silver value 3.5 ppm is found in the same sample as the highest Mo result (160 ppm). Copper values (Map 3) contoured at 26 and 36 ppm (see histogram Figure 6) provide a similar anomaly with apparently greater downslope

dispersion. Patchy areas with Mo greater than 10 ppm and copper greater than 26 ppm trend discontinuously off to the northeast or north-northeast and these often possess associated elevated silver.

Attempts to contour lead and zinc did not result in useful patterns. Zinc appears to concentrate in a few locations perhaps above basaltic dikes which are known to have elevated zinc concentrations in some cases. The geochemistry described above, however, cannot be explained by the presence of these dikes.

A geochemical orientation survey (Appendix 3) carried out using samples that contained high Mo and Ag values and background samples selected from elsewhere on the property (1983 collection) indicate that antimony, arsenic, and fluorine are also anomalous in this area. The basaltic dikes in the region do not explain the anomaly.

A few rock samples were submitted for geochemical work (Appendix 3). One amphibolite (dike?) at L600W/40N reported 28 ppb gold and 40 ppb gold on re-analysis.

#### GEOPHYSICAL EXAMINATION OF THE DETAILED GRIDS

VLF-EM surveying using stations Cutler and Hawaii was carried out on both grids to detect any conductive structures that might be present and to test its capacity to trace lithologic contacts in overburden covered areas. A Geonics EM 16 was used and readings were made on selected lines at the soil sample sites. A magnetometer survey was carried out on grid "B" as a means of identifying any alteration patterns or mineralization that might be present. A Scintrex MP-2 magnetometer was used with the detector on a packsack.

#### VLF-EM Results

The peaks are easily correlated on the two lines completed on grid "A" (Map 8). The main item of interest is the crossover obtained at the slate-limestone contact (this position is exposed in the Tootsee River). From this work and that completed on adjoining claims to the east, it is apparent that this contact could be readily traced throughout the overburden covered area. The limestone is a favourable host for

Marbaco-type vein mineralization, and its position would be of interest in any overburden drilling program that must be conducted to effectively explore this area.

The patterns obtained on grid "B" are similar to those obtained to the east on adjoining properties. The double peak on line 600W at 30 and 90S is characteristic of that associated with the carbonaceous sandstones and platy siltstones that form the upper part of the Kechika Group. The picture is somewhat more complicated to the west apparently caused by the abrupt curvature of the topography.

As the anomaly elucidated by the detailed geochemistry appears to be discordant (fracture-controlled) with a north-northeast strike, the lithologic information to be gained by further VLF-EM surveying is possibly of academic interest. Using a more southerly station, however, it may be possible to delineate structural control by using east-west oriented traverses.

#### Magnetometer Results

The highest magnetometer readings (+58600 gammas) are concentrated in the area of anomalous Cu, Mo, Ag geochemistry and hence related to the alteration or mineralization. It appears that magnetometer will may be useful in further exploration and definition of this anomaly.

#### GEOLOGICAL EXAMINATION OF DETAILED GRID "B"

The area covered by the grid is greater than 95 percent overburden-covered. Enough outcrop is present to establish that platy siltstones and carbonaceous quartzites (Kechika Group) overlie a unit consisting of green to silver banded phyllites. There is evidence of two early penetrative cleavages which intersect to form pencil lineations within the platy siltstones. Fold closures associated with these structures were not observed, however, the resulting compositional layering can be seen to be concentrically folded (warped) about a southeasterly plunging axis. The axial plunge is about 20 to 30° similar to the dip of the metamorphic package as a whole.

The next unit up in the sequence is a dolomitic quartzite but it was not observed in outcrop on the grid. The base of this unit is probably located well south of the area sampled.

A few basaltic dikes are found north of the baseline. The attitude of these dikes is obscured by overburden but it is probable they are near vertical and strike north-south as is usually the case in this region. They often appear to fill a fracture set that is sometimes associated with minor faulting.

A down-dip projection of the limestone underlying grid "A" would indicate that the unit would be found at a depth of approximately 100 m below the level of the Tootsee River at the position of the silver-copper-molybdenum anomaly. If the assumed faulting mapped by the G.S.C. (Map 18-1968) is correct, the limestone may be considerably shallower. If a Tertiary intrusive is present below anomaly "B", its intersection of the limestone horizon may be a zone with good potential for mineralization.

## CONCLUSIONS

Results obtained on anomaly "A" are inconclusive and probably adversely affected by deep glacial moraine. Further testing of this area would require a technique such as overburden drilling. The presence of conductive slate units in the section may make geophysical interpretation difficult.

On grid "B" a coincident silver, copper and molybdenum anomaly trends in a north-northeasterly direction and is open to the south. A related magnetic anomaly is also present. Elements found in epithermal alteration systems such as antimony, arsenic and fluorine are present in anomalous concentrations within this silver-copper-molybdenum anomaly. These features, especially in light of the recent discovery of significant gold intersections in Tertiary quartz-eye porphyry on the YP claims to the north, invite vigorous further exploration of this portion of the claim group.

## RECOMMENDATIONS

Additional geochemical and soil sampling is required in order to extend anomaly "B" to the south-southwest. Soils should be analyzed for Cu, Mo and Ag. Magnetometer surveying should be continued. Upon complete delineation of the anomaly, a diamond drilling program should be implemented.

A budget required to complete the evaluation of this anomaly is outlined below.

**BUDGET**

Geologist	8 days	\$ 2,400.00
