SOIL GEOCHEMISTRY, TRENCHING AND SAMPLING REPORT

ON THE GOLDEN STRANGER CLAIMS 1985

INTRODUCTION

TERMS OF REFERENCE

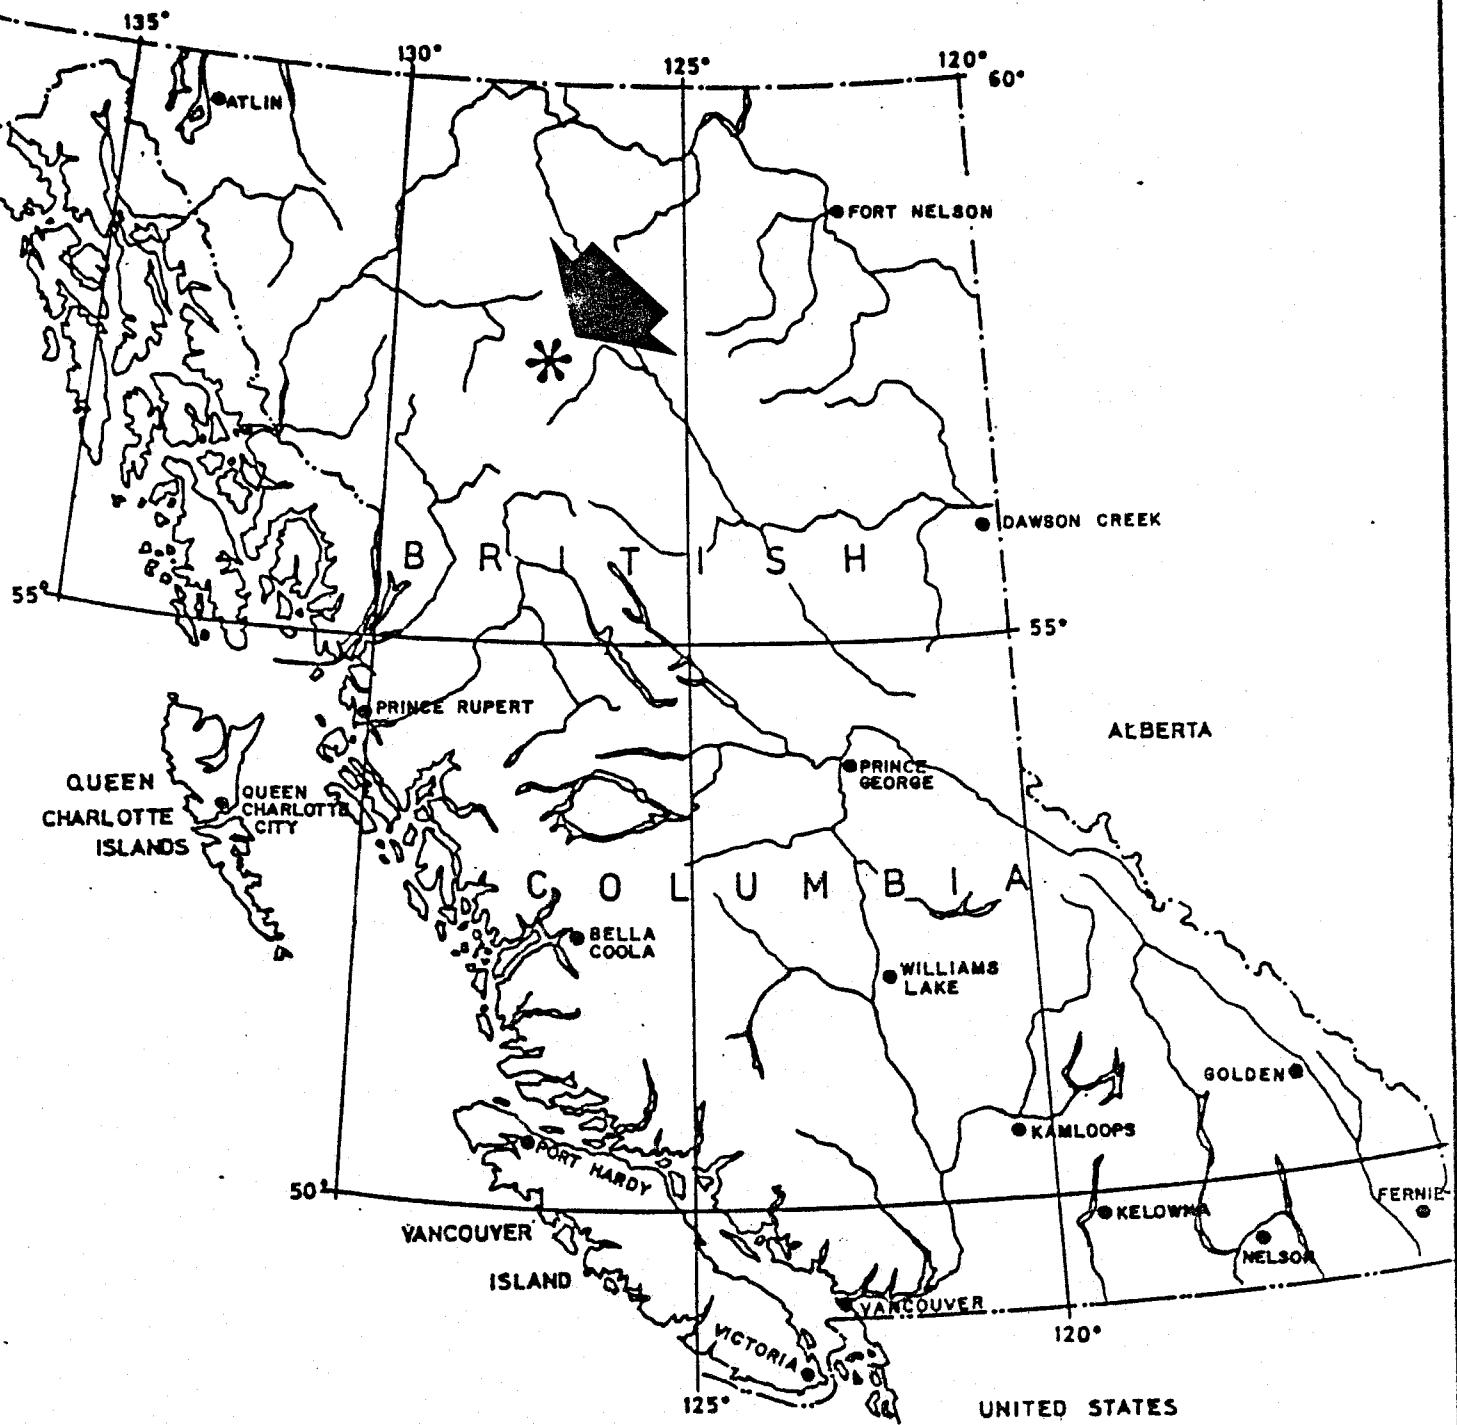

Gower, Thompson and Associates Ltd. was contracted by Western Horizons Resources Ltd. and their joint venture partners Sutton Resources Ltd. and Redfern Resources Ltd. to conduct a surface trenching, sampling and soil geochemistry program on the GOLDEN STRANGER and GOLDEN STRANGER II claims. This work was done by S.C. Gower, B.Sc. geologist, assisted by E.M. Thompson in the period August 1 to September 30, 1985.

LOCATION

The GOLDEN STRANGER claims are located approximately 24 kilometres (15 miles) northwest of Sturdee River airstrip. The property lies between the headwaters of Toodoggone and Chappelle Rivers and on the west of Lawyers Creek, at latitude $57^{\circ}16.5'N$, longitude $127^{\circ}15.2'W$, NTS 94E/6W in the Omineca Mining Division. The property is at approximately 1500 metres elevation (5000 feet). See Figures 2 and 3. The claims are accessible by helicopter from Sturdee airstrip.

CLAIM STATUS

The claims comprising the Golden Stranger 1 group, totalling 12 units, are listed in Table II and shown on Figure 5.

TABLE II
GOLDEN STRANGER I GROUP

CLAIM	UNITS	RECORD NO.	ANNIVERSARY DATE
GOLDEN STRANGER	9	4882 (11)	November 3, 1986*
GOLDEN STRANGER II	3	5671 (8)	August 29, 1987*

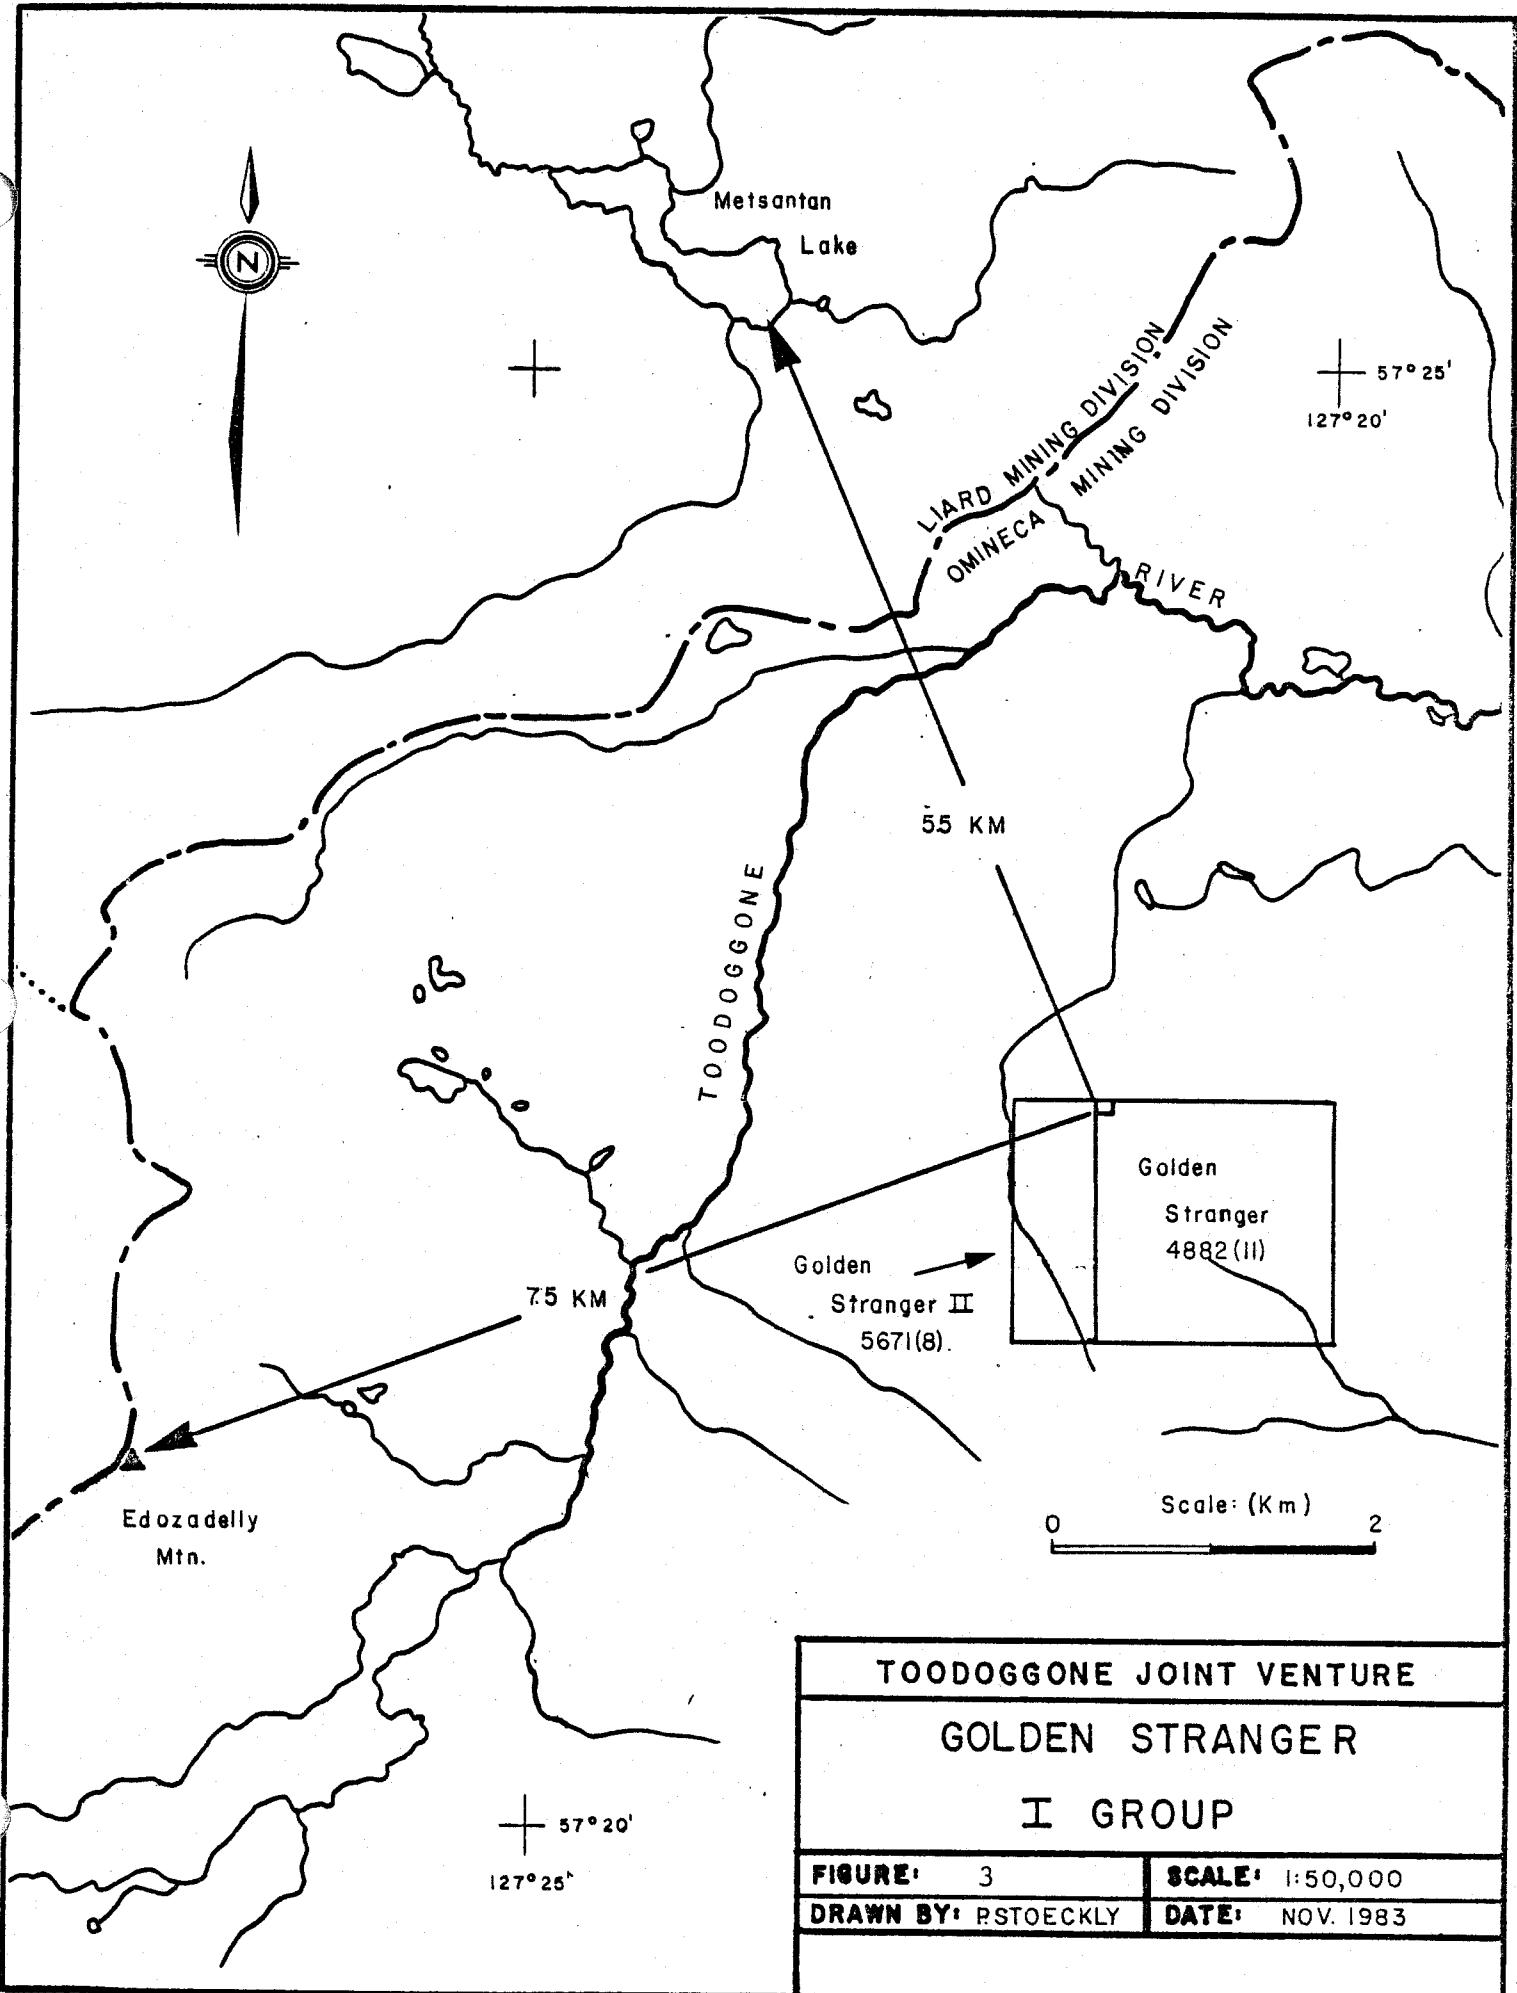

* Ten years assessment work has been applied to each claim to extend the expiry date of GOLDEN STRANGER to November, 1996 and GOLDEN STRANGER II to August 29, 1997.

Notice to Group GOLDEN STRANGER and GOLDEN STRANGER II was filed October 31, 1983 under the group name Golden Stranger #1. The legal corner post is located 5.5 kilometres (3.5 miles) southeast of Metsantan Lake and 6.5 kilometres (4 miles) northeast by east of Edozadelly Mtn. The GOLDEN STRANGER claim is owned by Western Horizons Resources Ltd. by Bill of Sale, August 2, 1983, from E. Thompson. The GOLDEN STRANGER II claim was staked on August 13 and 14, 1983, by Western Horizons Resources Ltd.

GEOLOGY

GEOLOGY OF THE GOLDEN STRANGER PROPERTY (From Assessment Report on Golden Stranger by Gower and Northcote, November 30, 1983)

The GOLDEN STRANGER claims are underlain by massive Toodoggone volcanics consisting primarily of andesite porphyry and lesser crystal tuff and tuff breccia which are of similar appearance to andesite porphyry but less well indurated. Some of these volcanics have primary hematitic matrix and/or lithic fragments. They range from unaltered grey or purplish red porphyritic to secondary weathered hematitic which has resulted in pinkish coloration of plagioclase phenocrysts and in the rock matrix in more

intensely weathered zones. The andesite porphyry volcanics in the claims correspond to Unit 6B of MEMPR Preliminary Map 61 by Diakow, Panteleyev and Schroeter, 1985. The Toodoggone volcanics are unconformably overlain to the southwest by Sustut sediments. See Figure 4.

The Toodoggone volcanics have superimposed northerly trending zones of hydrothermal alteration of varied intensity; most of which are associated with northerly trending fracture and shear-fault systems. See Figure 4. These systems served as deep-seated channelways for hydrothermal solutions and magmatic differentiates and have undergone successive episodes of structural movement over a long period of time. Alteration in these zones ranges from disseminated pyrite with associated iron staining through epidotized, chloritized, pyritic propylitic and locally intense argillic alteration. Aplite dykes follow one or more of these northerly trending fracture-fault systems.

Quartz veining, also of varied intensity which cuts both altered porphyritic volcanics and aplite dykes, are present in some of the fracture-fault systems. Quartz breccias and multistage quartz layering are common with chalcedonic quartz along some vein margins. There are up to 10 or more successive quartz layers with drusy vugs and locally open drusy amethystine centres.

Variations in intensity of hydrothermal alteration, presence of aplite dykes and quartz-breccia vein systems probably represent related hydrothermal-magmatic processes which reached different structural levels in the Toodoggone volcanic sequence.

Aplite dykes are reported at the Kodah property at the same elevation, 1500 metres, as Golden Stranger. The Kodah property is approximately 6 kilometres east of Golden Stranger on the east side of Lawyers Creek.

Two divergent quartz-breccia zones approximately 180 metres apart comprise the "main" and "west" zones. See Figure 5. These zones, in porphyritic andesite, follow and are followed by later northerly and northwesterly trending fractures and/or fault-shear systems.

The multistage quartz-vein-breccia-aplite system on the east strikes approximately northerly and has near vertical dip. Where its full width is exposed it measures more than 30 metres wide and extends northerly for a length of more than 400 metres. Aplite dykes, which appear to have cut the system are themselves brecciated and veined by multistage quartz, are conspicuous at the north and south ends of the main system. See Figure 5. A strong fault gouge zone lies on the west flank of the north end of the main aplite-quartz-vein breccia system. The porphyritic andesite wall rocks have undergone porphyritic alteration which is particularly intense adjacent to the aplite bodies.

A number of outcropping and frost-heaved exposures of quartz-vein-breccias were found to the west of the northern aplitic zone. These may represent continuation or off shoots of the main zone. See Figure 5.

The west vein-breccia system does not appear to be as well developed as the main system to the east. See Figure 5. It is noted however, that this system is flanked on the east by a parallel linear depression which may be reflecting a major fault-shear structure. The best vein-breccia development was noted in exposures in closest proximity to this depression. There is potential, therefore, for improved vein-breccia development within or against this possible structure.

1985 PROGRAM

Ten trenches totalling 172 metres were blasted and hand trenched. Eighty-nine channel and chip samples were taken from these trenches and from outcrop and were assayed for Au and Ag.

In addition to the trenching, 36 test pits were blasted into rock to procure representative material for assay. Four of the pits failed to discover silicious rock and were not sampled. The blasting was carried out by filling 13"x18" plastic bags approximately 50% full of Amex explosives, inserting a stick of 40% dynamite as primer and connecting the individual bombs with B-LINE detonating cord for simultaneous explosion from a fuse assembly.

One hundred and sixty-one soil, silt and rock samples were collected for geochemical analysis. The soil samples were procured by digging down approximately 0.25 metres with a long-handled shovel. Sample notes were taken on depth of sample, soil colour, contained rock material and horizon. The sample sites were marked with coloured ribbon and the holes refilled. Silt samples were taken from drainages and dry gullies with notes procured on composition and the sites flagged with coloured ribbon. Rock samples were taken as part of geological mapping when interesting alteration or sulphide minerals were noted.

All data was plotted in the field on a scale of 1:500 and 1:2500. Samples were shipped to Bondar-Clegg laboratories in Vancouver for analysis by geochemical and/or fire assay methods. Pulps are available for re-analysis if required.

GENERAL TRENCH DATA

<u>Number</u>	<u>Length</u>	<u>Direction of Sampling</u>	<u>Average Depth</u>
Trench # 1	21.5 metres	east to west	1.0 metre
Trench # 2	22.1 metres	west to east	1.0 metre
Trench # 3	29.7 metres	west to east	1.0 metre
Trench # 4	32.3 metres	east to west	1.2 metres

158 - Rock, feldspar porphyry epidotized, galena
159 - Silt, dry gully loam
160 - Soil - B - pyritic, feldspar porphyry
161 - Silt, organic

DISCUSSION OF RESULTS

Previous work in 1983 on the property had resulted in the discovery of a strongly developed west dipping quartz-amethyst breccia trenching generally north over a strike distance of approximately 475 metres and a width of 25 metres. A subsidiary east dipping structure was discovered west of the main structure both of which apparently open to the south.

The purpose of the 1985 program was to determine by blasting test pits and trenches if the silicious structures were carrying gold and silver at surface and to explore beneath shallow overburden for addition mineral occurrences.

SIGNIFICANT ASSAYS

The following results were considered to be highly significant in the evaluation of the property.

	<u>Au/oz/ton</u>	<u>Ag/oz/ton</u>	<u>Description</u>
Tr.#3 ST-3-83-1041	0.02	0.14	2-metre width - silicious gouge
ST-3-85-1042	0.26	0.19	1.7-metre width - sicilious gouge
ST-3-85-1043	0.422	0.24	1.2-metre width - silicious gouge
Tr.#7 ST-7-85-1073	0.205	1.61	2.4 metres - silicious gouge
ST-7-85-1074	0.121	0.51	2 metres - gouge and dyke
Test Pits XP-85-104	0.012	0.76	Silicified feldspar porphyry
XP-85-106	0.033	0.05	Silicified feldspar porphyry
XP-85-109	0.016	0.09	Pyritic feldspar porphyry
XP-85-110	0.008	0.11	Quartz vein
XP-85-112	0.008	0.05	Pyritic feldspar porphyry
XP-85-115	0.009	0.09	Silicified feldspar porphyry
XP-85-124	0.017	0.08	Feldspar porphyry
XP-85-125	0.039	0.09	Silicified feldspar porphyry
E-85-017	75 ppb	0.03 ppm	Soil sample
E-85-099	5 ppb	2.2 ppm	Silt sample
E-85-107	10 ppb	3.1 ppm	Swamp
E-85-155	<5 ppb	4.0 ppm	Silt
E-85-156	<5 ppb	2.2 ppm	Silt
E-85-159	5 ppb	3.5 ppm	Silt
E-85-160	35 ppb	2.0 ppm	Soil
E-85-161	25 ppb	3.4 ppm	Soil
RE-85-051	320 ppb	9.8 ppm	Rock

Background geochemical values for gold and silver in silt and soil were considered to be less than 5 ppm Au and less than 0.02 ppm Ag. Anomalous values were considered to be greater than 20 ppb Au and 2.0 ppm Ag. In interpreting the anomalous silver values in some swampy environments, consideration must be given to the possibility of geochemical enrichment due to the influence of high organics.

Background values for gold and silver in rock were considered to be less than .002 oz. per ton Au and less than .03 oz. per ton Ag.

CONCLUSIONS

The quartz-amethyst breccia structure on the Golden Stranger property is definitely carrying anomalous concentrations of gold and silver. In addition to specific high assay values over significant widths (i.e., ST-3-85-1043), numerous lower values in the 0.002-0.004 range indicate the system is gold positive over greater widths.

RECOMMENDATIONS

Surface trenching over the main zones should be completed utilizing explosives or a small bulldozer-backhoe. Geophysical surveys, magnetics, and VLF-EM should be carried out to identify general rock types, possibly the alteration of rocks and resistivity anomalies under shallow drift cover.

After successful completion of this program, consideration should be given to diamond drilling to test for economic concentrations of gold and silver at depth.

PRELIMINARY ESTIMATED COST OF
EXPLORATION PROGRAM
1986 GOLDEN STRANGER PROPERTY

Professional fees and salaries (geological mapping, sampling, prospecting)	\$ 10,000
Accommodations - camp and food	10,000
Transportation - Fixed wing	\$ 6,000
Helicopter	5,000
Truck	1,000
	12,000
Trenching - bulldozer and/or explosives	25,000
Geophysical surveys - VLF-EM & Mag.	6,000
Assays	8,000
Miscellaneous charges:	
- preparation of report	2,500
- accounting fees and bookkeeping	<u>1,100</u>
	TOTAL: \$ 74,600 (CAN)

Stephen C. Jagger

STATEMENT OF COSTS

FIELD PERSONNEL:

S. C. Gower, August 6 - October 17, 1985 -	
46 person-days @ \$200/day	\$ 9,200.00
3 person-days @ \$125/day	375.00
E. M. Thompson, August 6 - October 17, 1985 -	
49 person-days @ \$100	4,900.00

FOOD & ACCOMMODATIONS	2,251.28
-----------------------	----------

MOBILIZATION/DEMOBILIZATION	1,014.00
-----------------------------	----------

AIRCRAFT SUPPORT	4,352.00
------------------	----------

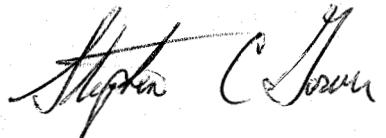

EQUIPMENT & SUPPLIES	2,590.94
----------------------	----------

LABORATORY ANALYSIS	3,408.00
---------------------	----------

REPORT PREPARATION	<u>1,000.00</u>
--------------------	-----------------

TOTAL:	\$ 29,091.22
--------	--------------

=====

CERTIFICATE

I, Stephen C. Gower, of 985 Gatensbury Street, Coquitlam, B. C., do hereby certify that:

1. I have been practising as a geologist for a period of approximately 16 years for mining exploration and consulting companies.
2. I obtained a B.Sc. in geology from U.B.C. in 1970 and have taken Masters courses in property evaluation and exploration.
3. I am a fellow in the Geological Association of Canada.
4. The exploration work in the report was carried out by S. C. Gower and E. M. Thompson in the period August 1 to September 30, 1985.
5. I am a shareholder and director of Western Horizons Resources Ltd., owner of the Golden Stranger claims.
6. I consent to the use of this report in, or in connection with a prospectus relating to the raising of funds.

Stephen C. Gower
