SUMMARY GEOLOGY (lithology, age, structure, alteration, mineralization, size, and attitude):

The area is underlain by the Upper Triassic to Lower Jurassic volcanic and sedimentary succession of the Vancouver and Bonanza Groups. Mid Jurassic quartz to granodioritic stocks (Quatse Stock) and quartz feldspar dykes and horn blende porphyry dykes and/or sills of undetermined age. Hydrothermal alterations and mineralization are associated with the porphyry dykes in Bonanza and Parson Bay tuffs and metasomatic alterations effect some sediments. The succession dips gently to the southwest at 30° - 40°.

INTRODUCTION

Between September 10 and September 21, 1985, two diamond drill holes totalling 542.6 m (1780 ft.) were drilled on the Bay 59 and Bay 60 claims, part of the Central 86 group of mineral claims. This formed part of the drilling program carried out in exploration for a near surface porphyry copper-molybdenum deposit. Drilling on the second of these holes was in progress at the time of filing for assessment - the remainder of the costs are included under separate cover.

PROPERTY DESCRIPTION

The Central 86 group consists of 100 claims/units adjoining and north of the Island Copper Mineral Leases.

Physiography:

The area is characterized by low to moderate hills with a maximum relief of 120 meters. Stephen's Creek cuts west across the central part of the group.

Access:

The area is accessible by paved road from Port Hardy, eight kilometers to the north and by logging road suitable for two wheel drive vehicles. The actual drill sites are located on newly built logging road subgrade accessible by tracked vehicles.

Previous Work:

Recent work by Utah has included mapping, VLF/Mag, IP and geochem surveys on and adjacent to the Central 86 group and diamond and percussion drilling west and southwest of the Bay claims.

Objective:

The objective of the drilling was to intersect a near surface porphyry copper-molybdenum mineral deposit. Previous drilling had indicated the presence of weak copper mineralization in the area and these holes were located to intersect higher grade extensions of this material.

Work Performed:

The following core holes were drilled on the group of claims.

Hole	Claim	Claim #	Mine Grid Co-ordinates		Elevation Meters A.S.L.	Length(ft)
			Easting	Northing		
E-63	Bay 60	17764	17492.1	15141.9	1197.5	495
E-64	Bay 59	17763	17250.0	16210.0	1200.0	1285 to Sept 21 1465 total to depth

The drill core was logged, photographed and measured for recovery, RQD (percent core greater than or equal to 2, 4, and 8 inches in length) and magnetic susceptibility. The core was split and sampled, normally in 10 foot intervals with variations as noted. Most of E-63 and portions of E-64 were only sampled over 1 - 10 foot run per 40 feet. Samples were run for copper, molybdenum, iron, gold and silver at the Island Copper assay lab. The core is stored in racks at the mine site.

E-63 was logged by G.A. Clarke, staff geologist and E-64 was logged by J.A. Fleming, Chief Geologist, both at Utah Mines Ltd., Island Copper Mine..

RESULTS

Hole E-63

The first metres (53 feet) was tri-coned away as overburden. In actual fact, the interval from 11.0 to 16.2 m (36 to 53 ft.) may have been soft bedrock; the first interval to 18.3 m (53 to 60 ft.) is a sheared, sericitic fault zone. From 17.1 to 30.5 m (56 to 100 feet) the rock is Bonanza volcanics, probably tuffaceous. Alterations are weak chloritization and sericitization associated with shears and silicification. From 30.5 to 42.7 m (100 to 140 ft.) is a bedded, moderately silicified Parson Bay sedimentary section with occasional tuff bands to 2 feet thick. A patchy weak pinkish/brown alteration probably reflects the presence of garnet. A strong fault zone exists from 42.7 m to 74.1 m (140 to 243 ft.) where core is completely sheared. Strong zeolite stockwork and minor quartz/calcite vein fillings heal the shear zones. Occasional unaltered parent fragments are non-banded pale green tuffs. Pyrite fracture fillings to 10% by volume and strong pyrobitumen (gilsonite) staining are scattered through the fault zone. From 74.1 to 150.9 m (243-495 ft.) Parson Bay tuffs and banded Parson Bay sediments alternate. Moderate chlorite and silicic alterations occur throughout with silicification preferentially favouring the finer grained sediments. Gilsonite is common as black fracture and veinlet coatings. Scattered very minor sphalerite and specks of molybdenite are noted.

Hole E-64

The hole penetrated 18.3 m of overburden. From 18.3 m to 295 metres was Parson Bay formation interlayered tuffs and sediments. Tuff bands are generally coarse ash texture, relatively even grained, non banded or bedded units to several metres thick. The sediments are finely laminated pale to dark green and pinkish brown banded (bedded). Alterations are weak to moderate chloritization which favours tuff bands, weak silicification, generally favouring finer sediments and patchy epidote and magnetite alteration. Some skarnification is noted between 154.5 m and 165.5 m. From 97.5 to 121.9 and 165.5 to 180.4 sections of sub. to euhedral hornblende porphyry cut the sequence. These consisted of large hornblende phenos to 15 mm and minor feldspar in a medium green aphanitic matrix. Weak chlorite alteration occurs in the 97.5 to 121.9 m run, weak chlorite/magnetite and minor epidote occur in the lower run. From 260.6 - 295 is Parson Bay tuffs. These are non banded and fairly

massive. From 260.6 to 274.3 a vague crystalline appearance may imply intrusive (dike) origins. This section has moderate chlorite and strong quartz carbonate and zeolite veining. Alterations from 274.3 to 307.2 m are weak silicification, moderate to strong chlorite and magnetite and minor epidote 2-3% sulphides, mainly pyrite are noted. From 307.2 m to 402 m is a medium grained quartz feldspar porphyry of dioritic to granodioritic composition. Patchy pervasive seolite alteration colours portions pink and weak chlorite in parts green hue. Minor sericite throughout section. Occasional biotite/chlorite-sericite altered andesite dikes are noted. From 402.0 to 425.8 metres is medium green uniform, fine grained (ash) tuff. Alterations are weak chlorite and magnetite with occasional strong magnetite. From 425.8 m to 452.6 m is a quartz-or granodiorite (Island Intrusions). It is fine grained, greenish grey with weak chlorite and moderate magnetite alteration. Runs of porphyritic material to 10 m grain size of the same composition make up about 10% of the interval.

DISCUSSION

The contact between Bonanza and Parson Bay formations projected from sparse surface mapping had to be substantially shifted southward by the occurrence of Parson Bay sediments in E-63. This may be a result of the strong faulting encountered in the hole. It has implications for the lower contacts of the sequence as well. The weak hydrothermal alterations suggested nearby heat sources which were not encountered in E-63. E-64 penetrated the predicted sections. The weak metasomatic alterations and silification in the upper section suggested the presence of intrusive material which was invisible to surface surveys. The intrusives encountered, notably the quartz feldspar porphyry, therefore were not a total surprise. Weak mineralization encountered throughout the hole eliminate the possibilities of economic porphyry ore in the area. The barren quartz diorite (stock) encountered at 1397 ft. (425.8 m) further reduces the economic search area.

CONCLUSIONS

The drilling has indicated a revision in stratigraphic boundaries and has eliminated the E-63/E-64 area from consideration for shallow porphyry mineralization. The sub-economic mineralization that is present, is too deep to be exploitable.

STATEMENT OF QUALIFICATIONS

We submit that we are qualified to prepare and present this report for assessment credit. Our qualifications are as follows:

J.A. Fleming

- 1) I have a B.Sc., (Major Geology) 1971 from McGill University.
- 2) I have been employed as a geologist continuously since June, 1968, and am presently Chief Geologist, Island Copper Mine, Utah Mines Ltd.
- 3) I have been a Fellow of the Geological Association of Canada since 1974.

G.A. Clarke - Geologist for Utah Mines Ltd., Port Hardy, B.C.

Completed B.Sc. (honors), (Geophysics) at University of Manitoba, in 1976; employed by Hudson Bay Oil and Gas, and Saskatchewan Dept. of Mineral Resources during the 1975 and 1976 summer field seasons as geophysical assistant; September, 1976 to February, 1977, Inco Limited, as a geologist in Thompson, Manitoba; Lloyd Geophysics, February, 1977 to May, 1979, as a geophysicist; Utah Mines Ltd., from October, 1979 to present, as geologist/geophysicist, presently under supervision of John A. Fleming.

SUMMARY REMARKS

- 0-95 POSSIBLY BONANZA VOLC.
MED GN FG (1 MM) AND TUFF (?)
ALT'N IS WK CHL/SER (A/W FLT) & SILICIFICATION.
SLCN STRONGER IN PINEST GN SECTIONS
- 95-140 BANDED NATURE IMPLIES PROB PARSON BAY SEDS.
SLC'D, WK PNK/BRN GARNET?? ALTN OF SOME BANDS.
SOME COARSER (TUFF) BANDS C/W CHL/PY +/- ZEO TO 2 FT THK
- 140-243 FAULT ZONE GENERALLY HEALED W WH ZEO, MINOR QZ/CALC
MOD-STR BRN GILS PERV STN.
SHORT RUNS GOUGY &/OR HLY SER'C STUFF
ORIG FRAGS WHERE RECOG.
FG PALE GN BLEACHED TUFF, NON BANDED
LOCALLY MOD-STR PY (TO 10%)
- 243-495 ALTERNATING PB TUFFS & BANDED SEDS.
GEN'L GY-GN, MOD CHL/SLCN ALT'N THROUGHOUT.
BRN GARNET (?) ALT'N AT 240-300 DECREASES DOWNWARD.
SLCN IS COMMON AS BK FRAC & VN FLNG
SLCN FAVOURS FINER, BANDED SECTIONS.
COARSER (TUFF) RUNS MORE HLY CHL/PY (+/- MAG) ALT'D
MINOR ZNS & MOS2 NOTED 420-425
POSSIBLE INTRUSIVE BXA @ 480-484

SAMPLE AT CONTACT.

A GREY, FINE GRAINED, CHL, MAGN ALT'D GRANITOIDS WITH ABT 15% ALT'D MAFICS IS CUT BY OR OCCURS AS COARSER PHASES (15%) GEN AS DYKES OR LAYERS 5-40 CM THK.

THE PORPHYRITIC PHASE HAS CHILLED MARGINS AT SOME CONTACTS, BUT AT OTHERS JUST GRADES RAPIDLY INTO THE FINE GRAINED VARIETY.

THE COMPOSITIONS ARE SIMILAR. MAFICS ARE ALT'D BID AND HBL PHENOS IN THE QFP.

THE PORPHYRY IS SIMILAR TO THE MAIN QFP IN HOLE.

1 PPQF FX QX PP I 4 K N

GA MX 0 3

SAMPLE WITH CONTACT BTW EQUIGRANULAR AND PORPHYRITIC INTRUSIVES.

SUMMARY REMARKS

60-320:

INTER LAYERED PARSON BAY TUFFS & BANDED SEDIMENTS. THE SEDIMENTS ARE VERY FINE GRAINED, WEAKLY TO MODERATELY SILICIFIED. PERVERSE LT BROWN STAIN (BRN CHL) IS MODERATE TO STRONG AT SUBCROP DECREASING WITH DEPTH, WK CHLORITE ALTERATIONS AND ZEO AND CARBONATE VLTS. OCCUR 63-320. OCC TUFFACEOUS HBL PORPHYRY AS 320-400.

320-400:

DK GREEN HORNBLENDE PORPHYRY C/W SUB-EWHEDRAL PHENOS TO 1 CM. ALTERATIONS ARE WEAK CHLORITE AND MINOR CALC/ZEOL VEINS. SULPHIDES ARE MINOR, SOME MoS2 ABT 380.

400-460:

SILICIFIED BANDED PARSON BAY SEDS AND TUFFS, WEAK EPIDOTE

DRILLHOLE/TRaverse : DDHE-064 (CONTINUED)

SUMMARY REMARKS

ALT. & ZEO VNS. MINOR CALCITE VEINS INCREASE TO 470.

451-507:

TUFFS CONTAIN CHL'D MAFIC PHENOS WITH INCREASE IN ZEOLITE VEINS
MINOR SER ENVELOPES. GILSONITE OCCURS AS SOOTY BLACK COATINGS.

507-543:

AS 451-507 WEAK EPIDOTE & POSSIBLE GARNET SKARN ALTERATIONS.
MINOR SPHAL.

543-592:

HORNBLENDE PORPHYRY AS 320-400 WK CHL/MAG/EPI ALTERATION
2% PYRITE, MINOR CPY, MoS2 & SPHAL.

592-855:

LIGHT AND DARK GREEN BANDED PARSON BAY SEDS AND TUFFS.
EPIDOTE ALTERATION IS WEAK AT 592 INCREASING TO MODERATE
AT 690 THEN DECREASING TO WEAK 820-855. MODERATE MAG 820-855

855-900:

VAGUE X'TALINE TUFF (DIKE?) MOD CHLDRITE, MOD-STR QZ, CARB, ZEO
VNS.

900-968:

PARSON BAY TUFFS WITH WK SILICIFICATION, MOD/CALC/ZEOLITES
AND MOD-STR MAG. 2-3% SULPH AS PY, TRACES MO. WK EPI, STR
CHL ALT 960-968.

968-983:

QUARTZ FELDSPAR PORPHYRY AS 1008-1319.

983-1008:

WKLY SKARNIFIED PB TUFF. OCC HBL PORPH CLAST. MODERATE CHL,
STRONG MAG AND CALC/ZEOLITES.

1008-1319:

QUARTZ FELDSPAR PORPHYRY, DIORITIC/GRANO DIORITIC COMP.
MOD-STR ZEO ALT AS VNS AND OCC PERV. CHL ALT GEN'LWK-MOD.
MINOR SERICITE.

MINOR BIOTITE/SERICITE/CHLDRITE ALTERED ANDESITE DIXES NOTED.

1319-1397:

PARSON BAY TUFFS, MINOR SEDIMENTS.

NON-BANDED WK CHL/MAG ALT'D & MODERATE BIOTITE.

1% VISIBLE CPY, TRACE MO.

PATCHY, STRONG MAG ALTERATION.

397-1485:

GRANODIORITE FINE GRAINED GREENISH GRY WITH WEAK CHL AND
MOD MAG ALTERATION. 10% COARSER PORPHYRITIC PHASE OF
SAME MATERIAL.
