1985 Diamond Drill Hole Plan C-D-113	Pocket

SUMMARY

One HQ wireline diamond drill hole (S-124), totalling 445.6 metres was drilled on the Phoenix Claim Group of Craigmont Mines Limited at Merritt, British Columbia.

This hole confirmed the downward continuation of low grade copper/iron mineralization previously intersected by shallower surface diamond drilling conducted in 1978. The host horizons are a series of steeply dipping calcareous epidote-actinolite skarn bands.

INTRODUCTION

This report contains the assay and geological results obtained from 445.6 metres of HQ wireline diamond drilling conducted on the Merchants 7 Mineral Claim of the Phoenix Claim Group. Diamond drilling was conducted by Rainbow Diamond Drilling Ltd. of Merritt, British Columbia between 16 September 1985 and 08 October 1985.

LOCATION AND ACCESS

The Phoenix Group of Mineral Claims is in the Nicola Mining Division centred on Latitude 50° 12½' N., Longitude 120° 55½' W. within Map Sheet N.T.S 92I/2W.

The claims lie on the northwest slope of Promontory Hill, immediately east of Stumble Creek.

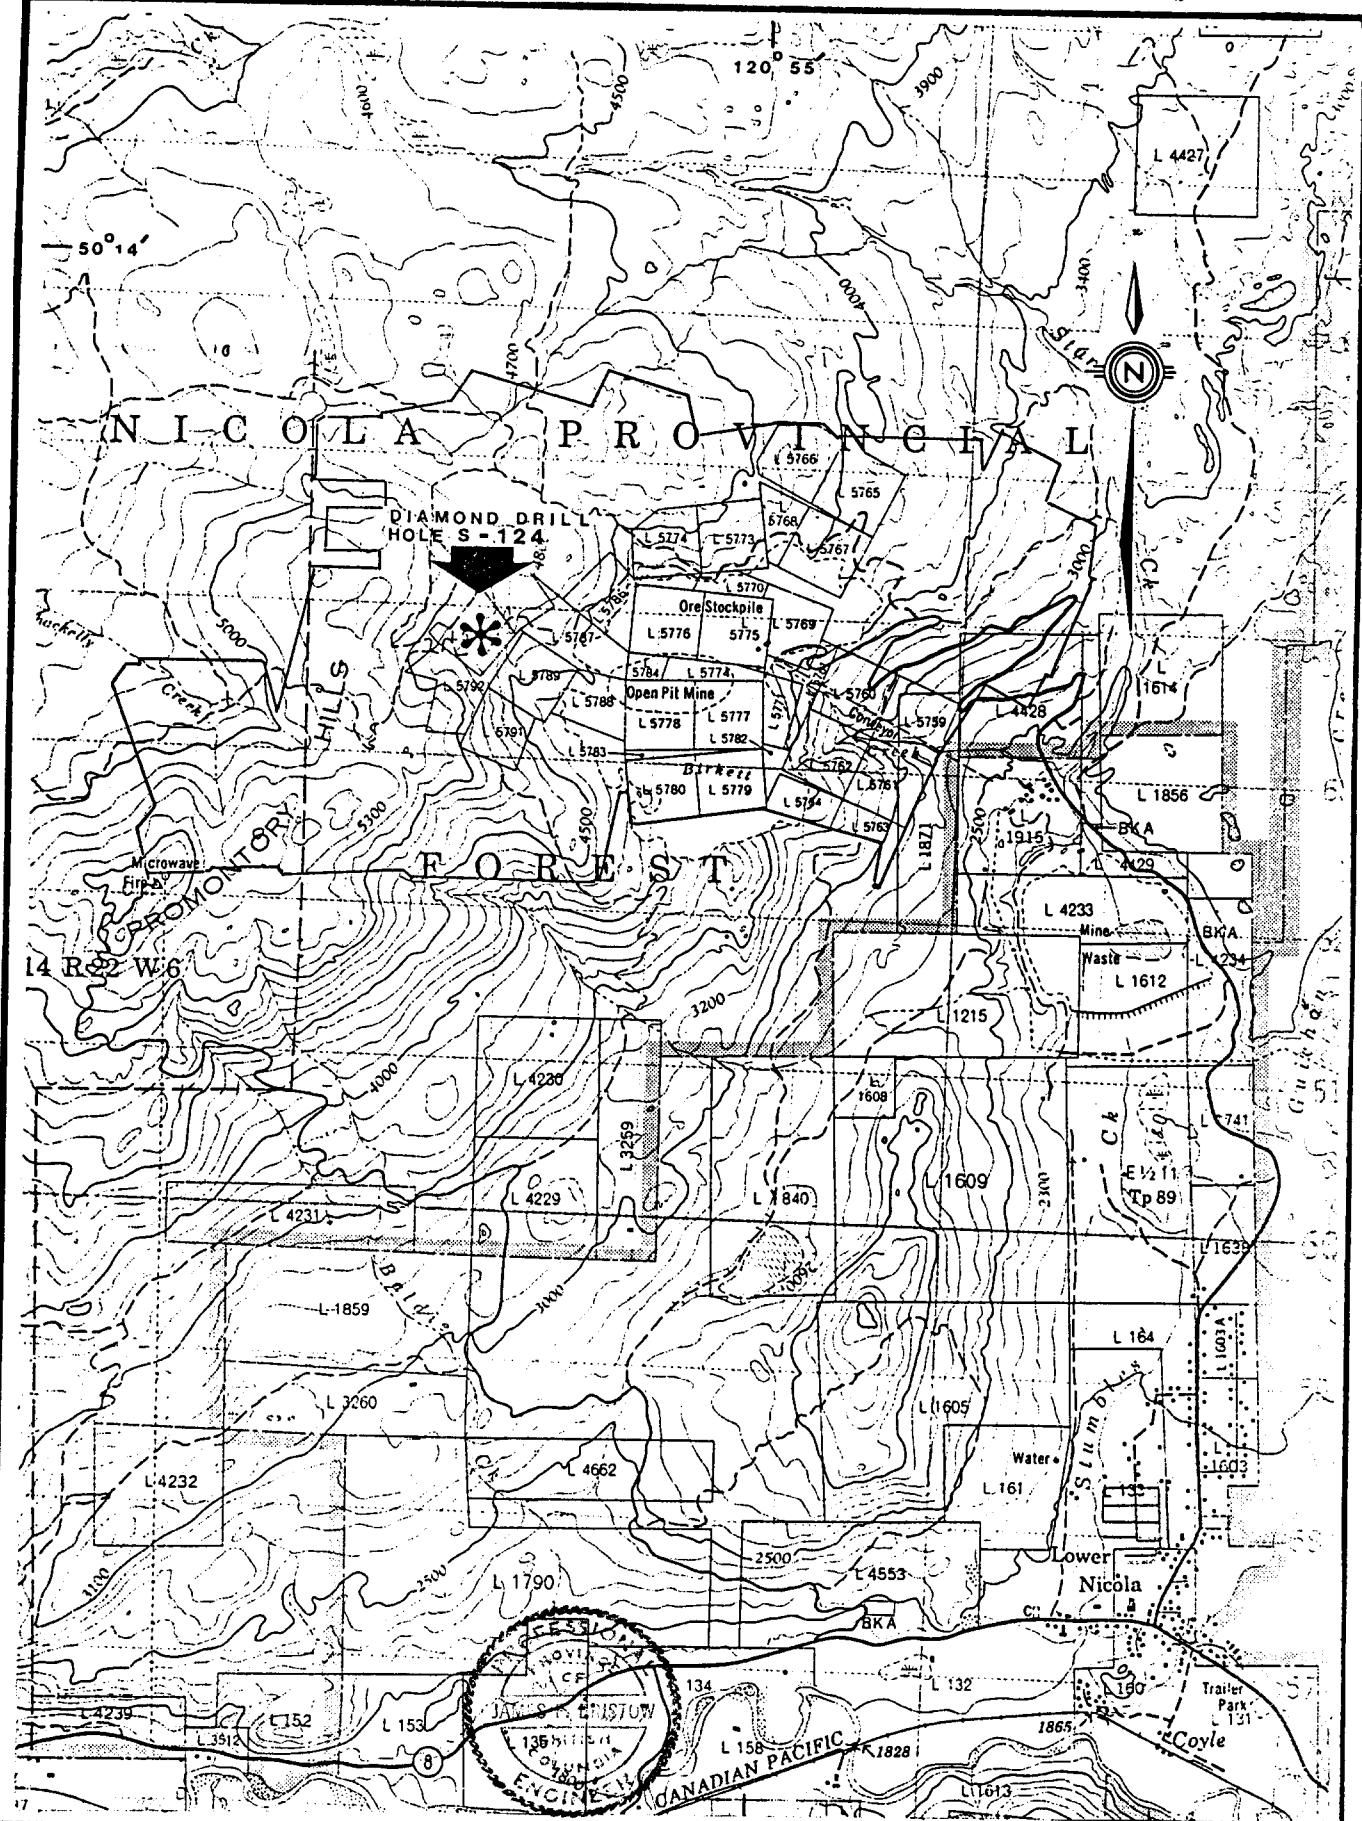

The property can be reached by six kilometres of paved road due north from Lower Nicola on Highway No. 8. (See Figure 2).

Access within the property is good, using a series of gravel mine haulage and exploration access roads.

TOPOGRAPHY AND CLIMATE

Elevations on the property range between 792 metres and 1706 metres. Slopes are generally moderate with the Craigmont Open Pit being the most prominent topographic feature on the property. Within the area, south and west facing slopes are generally sparsely wooded with ponderosa pine and north facing slopes are heavily wooded with spruce, lodgepole pine and alder.

Climate is typical interior plateau uplands with hot dry summers and cold moist winters.

**CRAIG MONT MINES LIMITED
AREA MAP**

SCALE 1:50,000

HISTORY

The history of Craigmont Mines Limited is relatively short, although the Eric Showing, situated approximately 1600 metres east of the open pit, was diamond drilled and trenched during or before 1935. The original company formed to work in the Promontory Hill area was called Pine Crest Mines Limited. This company, through reorganization, was incorporated as Craigmont Mines Limited in 1946. The 14 key mineral claims which form the core of the present property were acquired in 1954. Prior to 1957, geological and geophysical work were concentrated in the northwest corner of the property in the vicinity of Jackson Lake and the Paystic Showing. This work was concentrated on magnetic anomalies of negative intensity similar to those associated with the Porphyry Copper mines in the Highland Valley. It is interesting to note that the Craigmont ore-bodies are associated with magnetic anomalies of extremely high magnetic intensity. By the fall of 1957, diamond drilling through the drift covered area above the No. 1 orebody had encountered extensive copper-iron mineralization. By mid-1958, diamond drill hole no. 15 confirmed the possibility that an orebody of substantial proportions was being delineated. This drill hole passed through the centre of the No. 1 Orebody intersecting 195 metres grading 4.40% copper.

Canadian Exploration Limited directed and financed exploration from November 1957 to July 1958, when underground development was undertaken by an operating group, Birkett Creek Mine Operators Limited. This group, consisting of Canadian Exploration Limited, Noranda Mines Limited and Peerless Oil and Gas Company was dissolved in 1960 when the same interests became the mine operators as Craigmont Mines Limited.

In 1985, the Company was purchased by M. Seven Industries Inc.

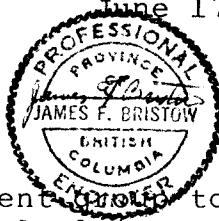

On cessation of underground mining in 1982, the property had produced in excess of 36,400,000 tons of ore grading approximately 1.29% copper.

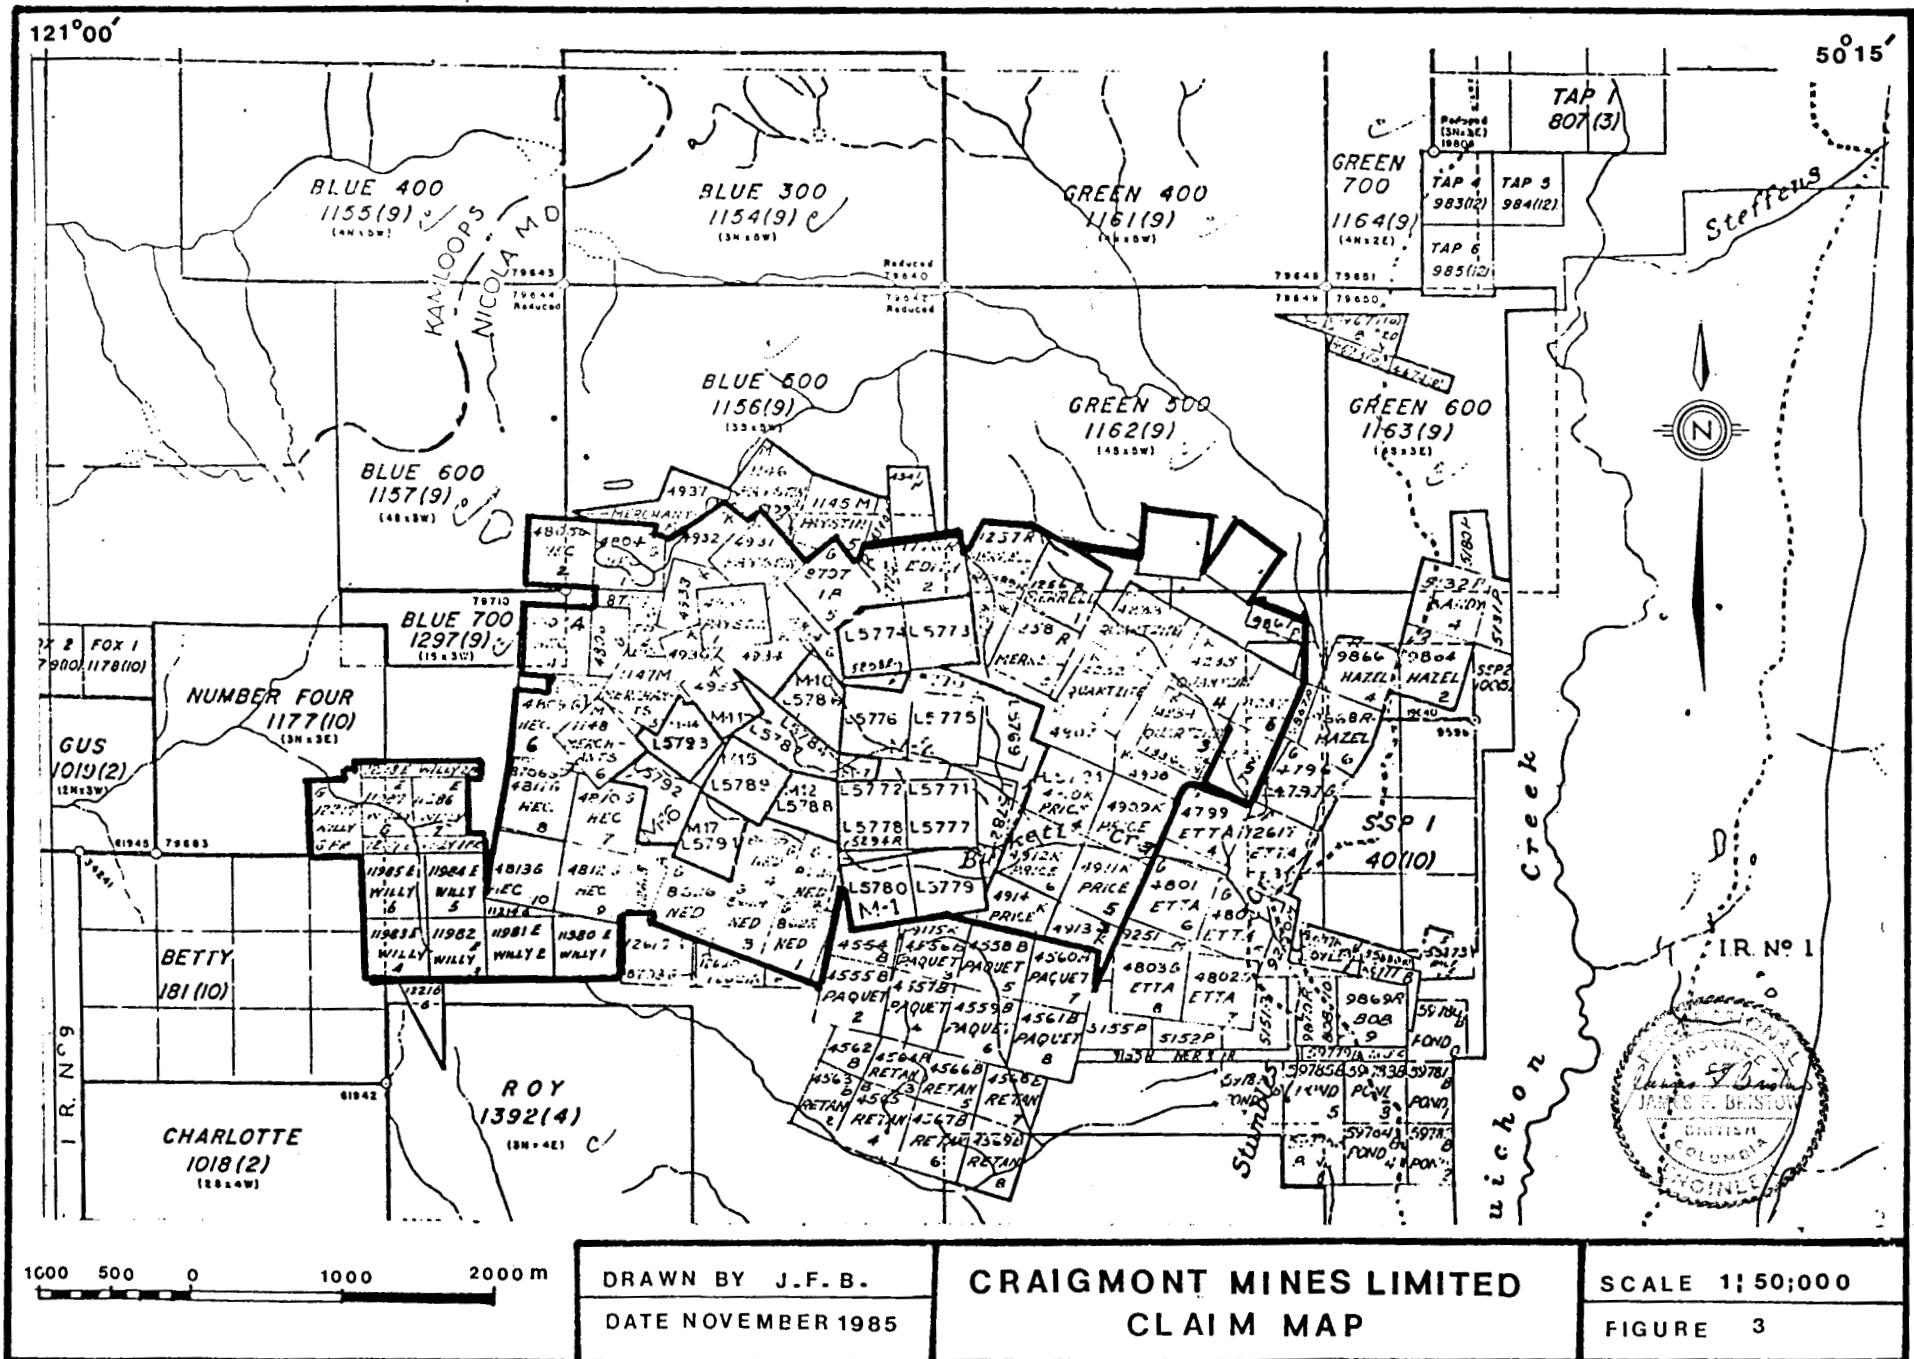

PROPERTY DESCRIPTION

The Phoenix Claim Group owned by Craigmont Mines Limited of Vancouver, British Columbia is composed of the following contiguous two post and mineral leased claims as shown on Figure 3.

Claim Name	Units	Due Date	Record or Lot Number

TOTAL	100		

* - Record Date - The current record totals 100 units and fractional claims.

DISCUSSION

(a) Geological Setting

Promontory Hill is underlain by a complex series of northwesterly trending steeply dipping volcanogenic Triassic Nicola Group rocks. The area of greatest geological interest is bounded to the west and south by the Nicola River, east by the Guichon Creek Valley, and on the north by the Jurassic Guichon Batholith.

The lithologies being tested by the current surface diamond drilling contain sequences of andesites, dacites and volcanogenic graywackes with interbedded limy sediments and limestones. One of these limestone bands lying within the alteration aureole of the multistage Guichon Batholith is the host rock for the Craigmont copper-iron skarn deposit.

Cretaceous Kingsvale Group agglomerates and flow rocks form a veneer up to 200 metres thick over approximately 20% of the Promontory Hill area. These flat lying flow rocks mask the west end of the Craigmont orebody and also the possible westerly continuation of the favourable skarn zone.

The origin and detailed geological environment of the Craigmont orebody is complex and evokes considerable geological discussion. One of the current geological models envisages the orebody being hosted within a limestone horizon lying between a southern dacite and a northern volcanoclastic sediment (greywacke) and all lying within the alteration aureole of the Guichon Batholith.

Exploration west of the present Craigmont Pit is limited to surface diamond drilling. Unfortunately, the varying magnetic susceptibility and conductance of Kingsvale cappling, plus bentonitic mud associated with the Nicola-Kingsvale contact preclude the use of most geophysical exploration techniques in this area.

DISCUSSION - continued(b) Purpose of Diamond Drill Hole S-124

Diamond drill hole S-124 was drilled to further test the favourable skarn horizon for economic mineralization in an area completely masked by in excess of 150 metres of Kingsvale volcanics.

(c) Diamond Drilling Statistics

Diamond drill hole S-124 was collared at 11162.7 North, 4561.0 East (mine grid coordinates) on the Merchant 7 Mineral Claim (See Figure 4 and Drawing G-D-113). It was drilled at 352° azimuth - 66° North for a distance of 445.6 metres. The following reductions in size were necessitated by ground conditions, 0-10.97 metres (HW), 10.97-162.8 metres (NW), 162.8-246.9 metres (NQ), and 246.9-445.6 metres (BQ).

Acid dip tests at 198.1 and 382.5 metres indicated that no appreciable change in dip occurred in spite of generally poor ground conditions. The core was logged, mineralized areas split, and subsequently stored in core sheds at the Craigmont minesite.

(d) Results and Interpretation

Surface diamond drill hole S-124 was collared approximately 90 metres west of the Winney Creek-West Embayment Fault. This fault is near vertical and believed to trend at 135°. Movement along the fault is left lateral, with little vertical component and uncertain horizontal displacement. The close proximity of S-124 to the Winney Creek Fault likely accounts for the poor ground conditions encountered in most of the siliceous rocks penetrated by this drill hole.

The hole cut only 6.4 metres of overburden before penetrating 141.9 metres of Kingsvale agglomerates and flows. The top of the Nicola Group was badly weathered but not as bentonitic as in previous drill holes.

DISCUSSION - continued

(d) Results and Interpretation - continued

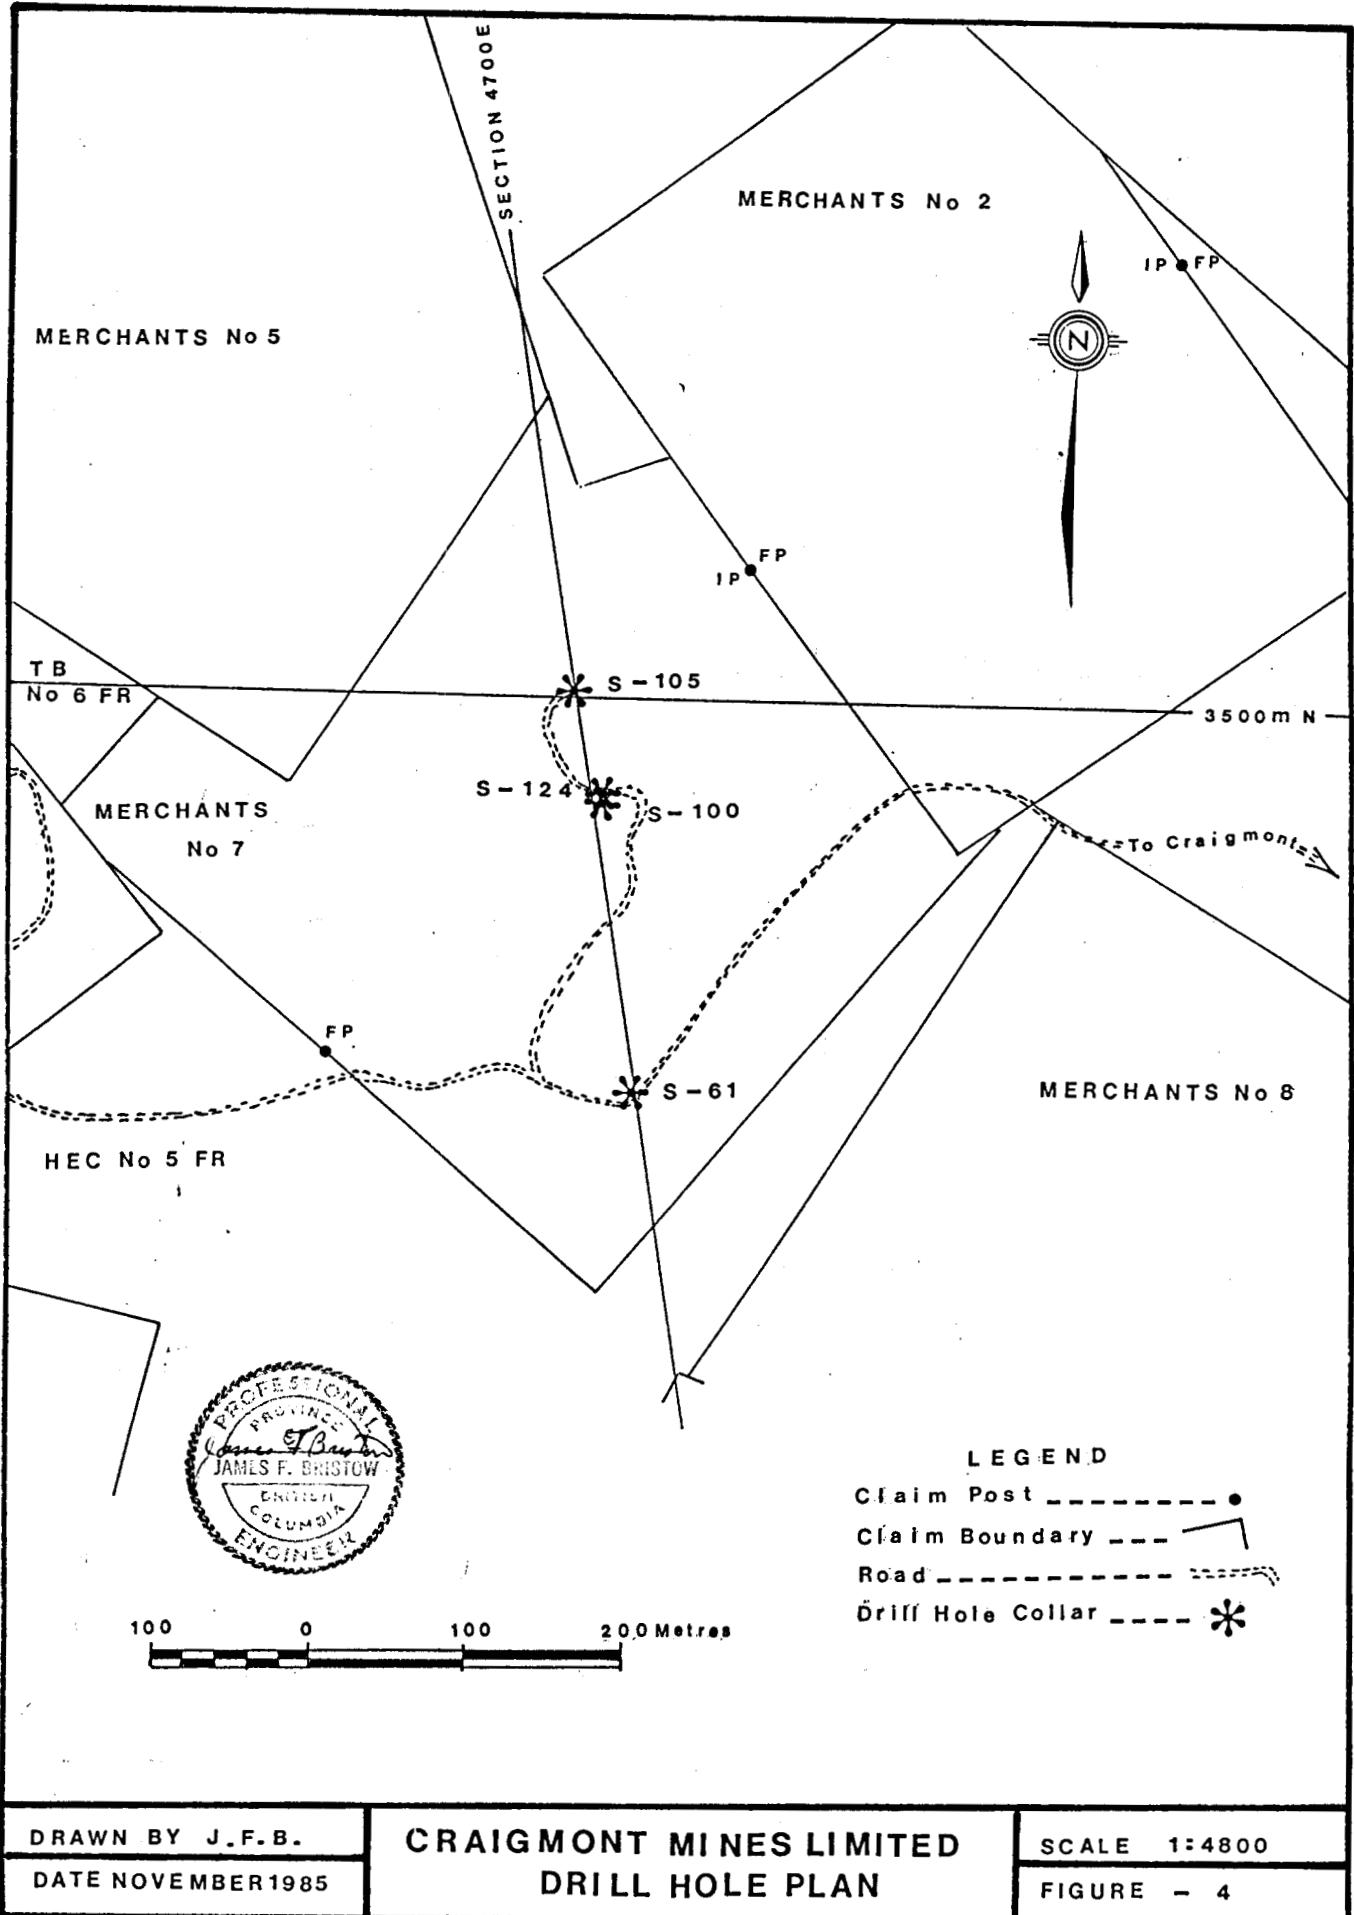

The limestone intersected between 172.5 and 194.5 metres appears to pinch out down dip.

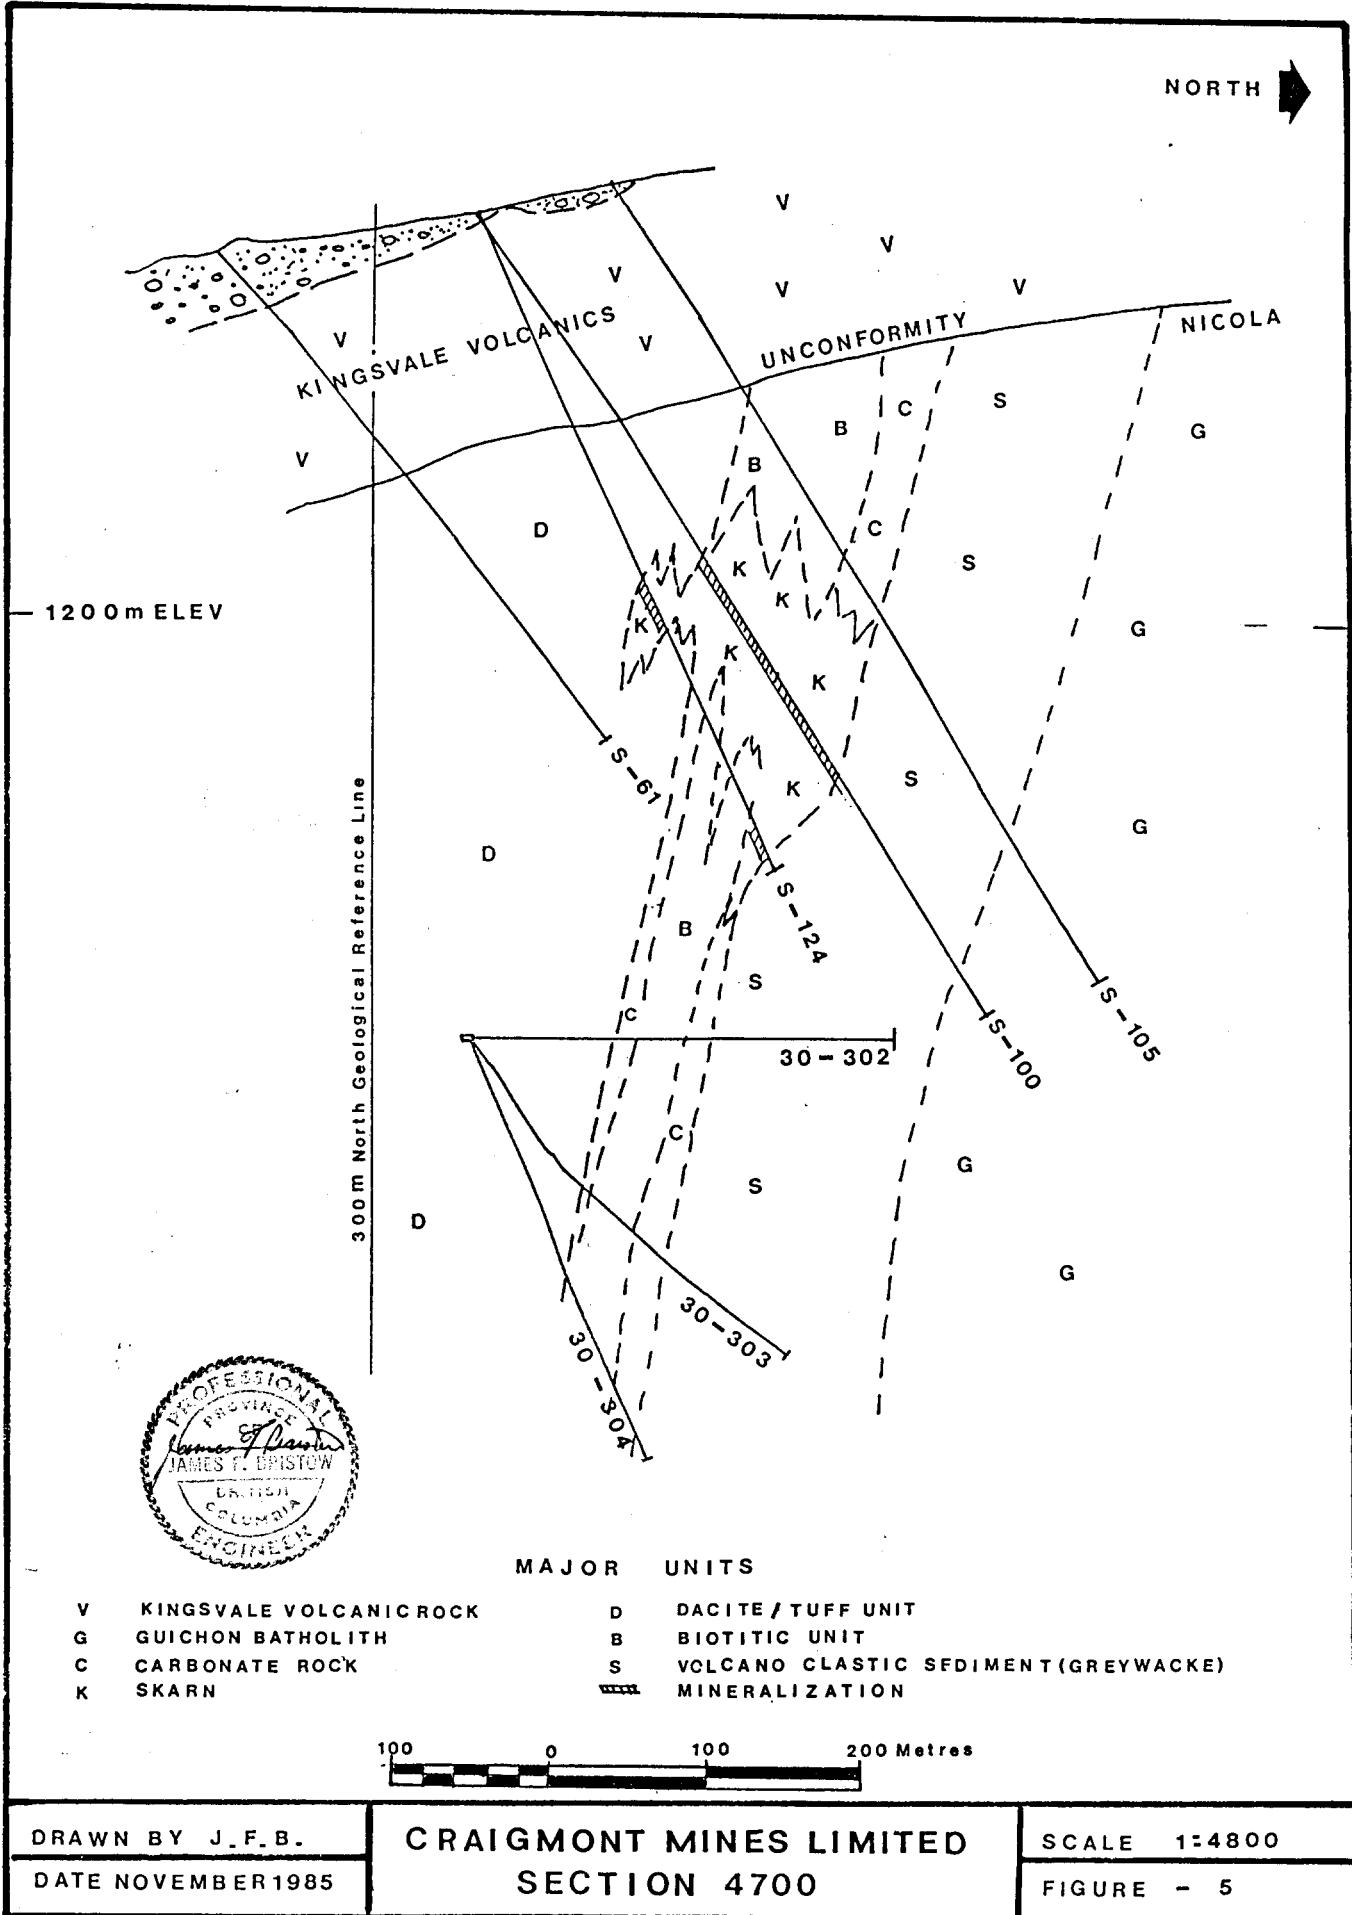

Three epidote-actinolite skarn zones were intersected, namely, 254.5 to 198.1 metres, 343.5 to 361.8 metres, and 387.7 to 391.1 metres (See Figure 5).

Minor copper mineralization was encountered in the first and third zones, however, it was of sub-economic grade. (See attached diamond drill log.)

CONCLUSION

The hoped for improvement in grade of the down dip extension of the mineralization intersected in diamond drill hole S-100 was not encountered. It is unlikely that an economic orebody exists between diamond drill holes 30-304 and S-105.

QUALIFICATIONS & CERTIFICATION

I, James F. Bristow, of 3431 Bowen Drive, in the Municipality of Richmond, Province of British Columbia, hereby certify as follows:

1. I am a graduate of the University of British Columbia, with a B.A. Degree (Geology and Physics).
2. I am a Professional Engineer, registered in the Province of British Columbia.
3. I am a member of the Canadian Institute of Mining and Metallurgy, the Association of Exploration Geochemists and the Geological Society of South Africa.
4. I have actively practiced my profession in mineral exploration and mining geology since my graduation in 1957.
5. That this report is based on data either gathered by myself or by persons working under my direct supervision.
6. That I have no interest, either direct or indirect, in the property or securities of Craigmont Mines Limited, nor do I expect to receive any.

Dated at Richmond, British Columbia this 22nd day of November 1985.

James F. Bristow, P. Eng.
