2.0 INTRODUCTION

During 1985, thirty-six holes totalling 3,820 metres were diamond drilled on Table Mountain by Erickson Gold Mining Corp. This program had two objectives: 1) locating new, major ore bodies on Table Mountain; 2) delineating ore shoots within the Vollaug vein.

Nine of the thirty-six holes (954.6 metres) were diamond drilled on the Hurricane Number 4 claim, Mint Group. The hole numbers and relevant data for this drilling are summarized in Table I. The core was logged by Gordon Sobering, B.Sc., and stored at the Erickson minesite. A Statement of Qualifications for Mr. Sobering is located in Appendix A. Copies of drill logs can be found in Appendix B and copies of assay results in Appendix C. Maps showing the collar locations in relation to claim boundaries are located in the back pocket of the report.

3.0 LOCATION AND ACCESS

The Mint Group claims are situated on Table Mountain, about 15 air-kilometres southeast if Cassiar, northernmost central British Columbia (Figure 1). Access during the summer months is provided by a well-maintained haulroad which connects both Troutline and Table Mountain portals with the Erickson mill. Much of the claim block is above timber-line. Relief is moderate with a gradual increase in elevation toward the summit of Table Mountain, to the northwest.

4.0 HISTORY

The Mint Group is comprised of twelve claims, situated on the southeast side of Table Mountain, which cover a portion of the Vollaug vein, a 2.7 kilometer long, gold-bearing quartz structure.

The Vollaug vein was discovered by John Vollaug and his partner, Hans Erickson, in 1935. It was optioned by the Cassiar Syndicate in 1936, and the option transferred to Cominco later that year. In 1937, Cominco dug a

TOTAL METRES: 954.6 (3131.9 feet)

number of surface trenches and drilled thirty-seven holes. Cominco relinquished the option later that year. Table Mountain Mines Ltd. acquired claims in the area from Bob Wilms and associates in the early 1950's. In 1973, a decline and drift were driven into the Vollaug vein for 248 feet. This was followed up in 1977 with an adit extension and two raises. In 1981, Plaza Resources went into production mining the Vollaug on surface, but was forced into receivership later that same year. Erickson Gold Mining Corp. acquired the property in September, 1983, and beginning in January, 1985, drove a 450 metre long drift along the vein.

The Hurricane Number 4 claim is owned by Table Mountain Mines Ltd.

5.0 GEOLOGY

Table Mountain is located within the Sylvester Allocthon, a fault-bound assemblage of upper Paleozoic chert, greenstone, clastic and ultramafic rocks, thrust over rocks autochthonous to the North America Craton. The rocks underlying Table Mountain are Sylvester Group volcanics and sedimentary rocks of late Devonian to early Mississippian age (see Geological Legend, Figure 2). Sedimentary lithologies include siltstone, chert, sandstone, argillite, greywacke and minor limestone. The volcanics include both flow-type rocks and pyroclastics. Ultramafic rocks, subsequently altered to listwanite, were probably emplaced in the Mississippian period. During the Tertiary, numerous diabase dykes were intruded throughout the area.

In the vicinity of Table Mountain, sedimentary rocks rest stratigraphically above a thick volcanic pile with interbedded chert. The contact between the basal member, black argillite, and volcanics is apparently a thrust fault. The vein and, in places, listwanite are located along this contact. This entire sequence of rocks has been subjected to a minimum of two periods of folding with fold axes striking east-west, and northwest-southeast. A series of north-south striking faults cut the Vollaug vein throughout its length. One large regional fault, the Erickson Creek fault, truncates the Vollaug vein to the west.

LEGEND - SYLVESTER GROUP

MISSISSIPPIAN TO (?) PERMIAN

SYLVESTER GROUP

Interbedded Sediments - 5D

5Da Greywacke

5Db Siltstone

5Dc Sandstone

5Dd Argillite

5De Limestone (continuous pods)

5Df Chert, ribbon chert, interbedded chert and argillite

Interbedded Volcanics - 5C

5Ca Massive meta-basalt to andesite flows, without pillows, occassional local phenocrysts of feldspar or pyroxene.

5Cb Meta-basalt to andesite tuff breccia and/or flow breccia, with local phenocrysts of feldspar or pyroxene, pillow volcanics.

5Cc Rhyolite, sills and/or dykes.

5Cd Argillaceous tuff and breccia.

5Ce Cherty tuff, tuffaceous chert.

5B Undifferentiated metasediments: Chert, tuff chert, includes some argillite, in northeast well layered chert - phyllite, ribboned chert and argillite.

5A Argillite, siltstone, chert, quartzite limestone pebble conglomerate, tuff includes numerous diabase and andesite sills.

FIGURE: 2

6.0 PURPOSE AND METHODS

Diamond drilling within the Hurricane Number 4 claim was undertaken to delineate the Plaza West Zone ore shoot, Vollaug vein (see Map 1). One hole, 85-574 was drilled approximately 200 metres north of the ore zone to test the down-dip extension of the Vollaug vein.

7.0 RESULTS

As a result of this drill program, 13,573 tons of additional ore was located within the Plaza West Zone of the Vollaug vein. Drill hole 85-574 failed to intersect the Vollaug vein 200 metres north of the ore zone.

8.0 RECOMMENDATIONS

The Plaza West Zone ore shoot is truncated to the west by a north-south striking fault. Drilling west of this fault has failed to intersect the ore zone. It is recommended that a fence of holes be drilled on Vollaug section 659 to test for into volcanics from the argillite-volcanic or argillite-listwanite contact.

9.0 HURRICANE 4 DRILLING COST STATEMENT

Nine BQ Diamond Drill Holes were drilled on the Hurricane 4 claim during the period from September 6 through 22. A total of 954.6 metres were drilled. During this period, there were 2 drills working on this and adjoining claims.

Hole Number	Date Drilled	Total Length	Drilling Cost
85-554	September 6-9	172.8m	$10,089.75
85-555	9-10	125.6m	7,067.50

10.0 STATEMENT OF QUALIFICATIONS

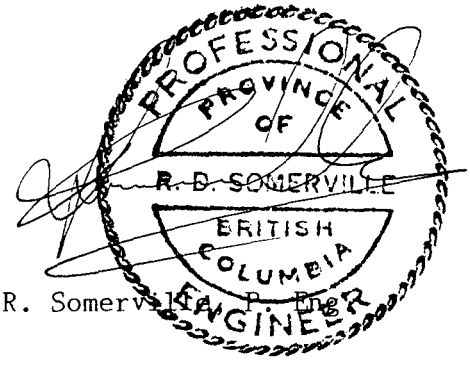
I, Eric Dussell, of 5457 Mosquito Lake Road, Deming, Washington, do hereby certify that:

I hold a B.Sc. degree in Geology obtained at the University of Washington, Seattle. I have practiced my profession for five years.

I am author of this report, which is based upon work conducted under the supervision of R. Somerville, P. Eng., during the 1985 field season on the claims covered by the Mint Group for Erickson Gold Mining Corp. near Cassiar, British Columbia.

Eric Dussell

E. Dussell, B.Sc.



R. Somerville, P. Eng.

APPENDIX A

Statement of Qualifications for Mr. Sobering

STATEMENT OF QUALIFICATIONS

I Gordon Sobering of 500-171 West Esplanade, North Vancouver, British Columbia, do hereby certify that:

1. I hold a B Sc. degree in Geology from Lakehead University, in Thunder Bay, Onatrio and have practised my profession for two (2) years.

2. I am a member of the Canadian Institute of Mining & Metallurgy.

3. I have logged the drill holes included in this report under the supervision of R. Somerville (P. Eng.) during the 1985 field season on the Hurricane 4 claim of Erickson Gold Mining Corp. near Cassiar, British Columbia.
