TERTIARY AND (?) EARLIER

## Conglomerate

- 11 Kechika, Sandpile, Atan loosely cemented.

AGE UNKNOWN - INTRUSIVES

## Dykes

- 10a Diabase  
10b Andesite - dacite  
10c Aplite

## Quartz Veins

- 9 Often containing sulphides (tetrahedrite arsenopyrite), graphite and sometimes visible gold.

UPPER CRETACEOUS

- 8 Cassiar Stock quartz monzonite porphyry.

AGE UNKNOWN

Listwanite (altered basic to ultrabasic rocks, may contain veinlets of quartz, dolomite, brucite and talc).

- 7a Serpentine, chlorite, carbonate, with minor talc.  
7b Talc, carbonate, minor chlorite.  
7c Quartz, mariposite, carbonate and minor talc.  
6 Diorite; volcanic plug ? Sill ?; locally fine-grained feldspar porphyry.

MISSISSIPPIAN TO ? PERMIAN

## SYLVESTER GROUP

## Interbedded Sediments - 5D

- 5Da Greywacke  
5Db Siltstone  
5Dc Sandstone  
5Dd Argillite  
5De Limestone (continuous pods)  
5Df Chert

## Interbedded Volcanics - 5C

- 5Ca Dacite to andesite flows, with or without pillows, occasional local phenocrysts of feldspar or pyroxene.  
5Cb Dacite to andesite tuff breccia and/or flow breccia, with local phenocrysts of feldspar or pyroxene.  
5Cc Rhyolite, sills and/or dykes.  
5Cd Argillaceous tuff and breccia.  
5Ce Cherty tuff  
5B Chert, tuff chert, includes some argillite, in northeast well layered chert - phyllite, tuff chert, ribboned chert and argillite.  
5A Argillite, siltstone, chert, quartzite limestone pebble conglomerate, tuff includes numerous diabase and andesite sills.

MIDDLE AND UPPER DEVONIAN

## McDAME GROUP

- 4a Dolomite (black) and limestone (grey) - numerous veinlets and vugs of dolomite, occasional laminations and nodules of chert.

## SANDPILE GROUP

- 3a Dolomite and dolomitic sandstone - dark grey to light grey, commonly laminated.

CAMBRIAN AND ORDOVICIAN

## KECHIKA GROUP

- 2c Argillite, shale, slate - black to grey-black; mostly argillite with a pervasive mild slaty cleavage, some selections of shale and slate; cherty and calcareous sections throughout, laminated to bedded, pyrite occurs as fine disseminations up to 1X and as fine streaks.  
2b Phyllite - black, friable, carbonaceous, with minor pyrite.  
2a Argillaceous limestone - grey-black, massive, with argillite and shale fragments

CAMBRIAN

## LOWER CAMBRIAN

## Atan Group

- 1f Limestone - blue-grey to dark grey, laminated to well-bedded to massive, with flaggy patches and minor fragmental or breccia sections.  
1e Recrystallized limestone (marble) - bluff, white, massive and as stringers and patches in 5De, large rhombohedral crystals.  
1d Dolomite - yellow, buff, brown, rose, crystalline, massive with some friable sections, minor pyritohedrons in the crystalline portions.  
1c Quartzite - maroon, green, brown, and tan, well bedded with cross bedded sections, pyrite and lesser pyrrhotite as disseminations and stringers.  
1b Hornfelsic quartzite - maroon, green, buff and brown; pure quartzite beds are crystalline, less pure beds are schistose and contain andalusite patches; chlorite clots occur in the chlorite-rich green beds; more abundant pyrite and pyrrhotite.  
1a Shale and slate - black, grey and buff, laminated, pyritic, and carbonaceous, with some calcareous interbeds.

ALTERATION SYMBOLS

## GEOLOGICAL LEGEND

FIGURE 3

## 1.0 INTRODUCTION

This report describes the work and results of a soil geochemistry program and prospecting carried out during the 1985 field season on the Beaver claims, Cassiar District, Liard Mining Division. Maps showing the claim location, geochemical grid, soil geochemistry results and preliminary geology, are included.

## 2.0 LOCATION AND ACCESS

The Beaver claim is located in northern British Columbia, 20 kilometres east-northeast of the town of Cassiar. The geographic co-ordinates are  $59^{\circ}19'$  north latitude,  $129^{\circ}31'$  west longitude.

Access to the area is by Highway 37 from Watson Lake, Yukon Territory which is approximately 150 kilometres to the north-northeast or from Kitwanga which is 655 kilometres south of the property. From Highway 37, the claim can be accessed by 4 kilometres of gravel road which goes up the east side of Hot Creek valley.

## 3.0 TOPOGRAPHY

The Beaver claim is located in mountainous terrain with valleys at 900 metre elevation and peaks at 1,670 metre elevation. Valleys are swampy with alder and buck brush. Mountain slopes begin at around 1,370 metres.

Within the claim, elevations vary 1,000 metres and 1,420 metres. The claim is located on the west slope of Hoskins Mountain.

## 4.0 HISTORY

The Cassiar District has been prospected since the 1800's and interest was stimulated after 1874 when placer gold was first discovered on McDame Creek 6 km. southeast of the Beaver claim. Placer gold and

copper, lead, silver and barite mineral occurrences in the vicinity of Hot Lake have resulted in continued interest in the vicinity of the Beaver claim. However, other than blazed trees, there is little evidence of previous work within the claim.

The Beaver claim was staked in 1984 by Erickson Gold Mining Corp. to cover possible extensions of soil geochemical anomalies outlined by work done on adjoining claims to the south. The work covered by this report is the first work performed on the claim by Erickson.

## 5.0 SUMMARY OF WORK

In the 1985 field season, one geologist, two linecutters and three soil samplers carried out a preliminary survey of the Beaver claims during the period from September 3 to September 16. The work involved grid establishment and linecutting, soil geochemistry and prospecting.

Prospecting within the claim was undertaken by one geologist over two days. The soil grid covers the northern two thirds of the claim. One hundred and fourteen samples were collected and analyzed for gold and for multi-element by ICP. Maps showing the results of this work are included in this report.

## 6.0 PURPOSE OF WORK

The purpose of the 1985 work was to delineate areas favourable for either gold-silver bearing quartz veins or sediment-hosted lead-zinc-silver deposits.

## 7.0 GEOLOGY AND MINERALIZATION

The area around the Beaver claim is underlain by Mississippian to Upper Pennsylvanian Sylvester Group rocks in fault contact with Cambrian Atan Group rocks. The Sylvester Group is comprised of metasediments and metavolcanics lying in a north-northwesterly orientated synclinerium. The

Atan Group rocks are fine-grained grey dolomites, limestones, and mature fine to medium-grained quartzites.

Within the Beaver claim, outcrop is sparse except for a prominent cliff along the north side of the creek which runs through the center of the claim. In the southwest corner of the claim, black, graphitic, thin-bedded argillite of the Sylvester Group occurs. Along the south side of the creek in the center of the property, there are sporadic outcrops of Atan Group quartzite and dolomite. The cliff north of the creek is comprised of massive blue-grey crystalline limestone and marble. Sporadic outcrops of yellow to buff, very fractured, massive crystalline dolomite and massive to well-bedded grey to tan shale occur north of the cliff.

Along the creek within the Atan Group carbonates, are found up to 30 centimetres wide rusty zones which occasionally contain replacement pods of pyrite-galena-sphalerite and, in one case, stibnite. All are of limited extent. Occasionally skarn minerals including garnet, diopside and actinolite, were observed in the mineralized pods.

## 8.0 LINECUTTING

A 1,050 metre long north-south baseline extending north from a baseline cut previously on the Bear 1 claim which lies to the south, and a 940 metre east-west line at 200 north, were cut 2 metres wide by chainsaw. The total of 1,990 metres of line cut required eight man days of labour.

An additional 3,900 metres of line in 4 east-west lines were flagged to provide control needed for a soil geochemical survey.

## 9.0 PROSPECTING

Prospecting was undertaken to get a basic idea of the geology within the claim, to attempt to find any economic mineralization, and to find any evidence of skarn mineralization.

A number of small replacement pods with pyrite and occasionally galena and sphalerite were found in outcrop along the creek which runs through the center of the property. In one locality, on the south side of the creek, stibnite was found in a 30 centimetre wide replacement pod.

One mineralized sample from the north side of the creek was assayed at the Erickson Mine assay lab. It contained only trace amounts of gold and silver.

## 10.0 SOIL GEOCHEMISTRY

### 10.1 Field Procedures

Soil samples were collected at 50 m. intervals along the north-south baseline and along the 5 east-west lines which are 200 m. apart. location of samples are plotted on maps included with this report.

At each sample site a hole approximately 30 cm. deep was dug with a mattock and soil from the B horizon was placed in a Kraft sample envelope with a garden trowel. Where the B horizon was not present, the bottom of the A horizon was sampled. A total of 114 samples were collected and sent to Min-en Laboratories Limited, 705 W. 15th St., North Vancouver, B.C. All samples were analysed for gold and for multi-element by ICP. A total of 114 samples were collected requiring 8 man days of labour.

As a laboratory check, every twentieth sample was removed and a sample of lake sand was sent in its place. The original sample was sent later and a 'D' put in front of the number in order to identify it.

### 10.2 Laboratory Procedures

#### Analytical Procedure for Au

Geochemical samples for Gold are processed by the following procedures at 705 Min-en Laboratories Ltd. at 705 W. 15 St., North

Vancouver.

After drying the samples at 95 degrees C., soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus mesh fraction for analysis. The rock samples are crushed and pulverized by ceramic plated pulverizer.

A suitable sample weight, 5.0 or 10.0 grams, is pretreated with  $\text{HNO}_3$  and  $\text{HClO}_4$  mixture.

After pretreatments, the samples are digested with Aqua Regia solution, and after digestion the samples are taken up with 25% HCL to suitable volume.

At this stage of the procedure, copper, silver and zinc can be analysed from suitable aliquote by Atomic Absorption Spectrophotometer procedure.

Further oxidation and treatment of at least 75% of the original sample solutions are made suitable for extraction of gold with Methyl Iso-Butyl Ketone followed by analysis for gold by Atomic Absorption Spectrophotometer procedure.

#### Analytical Procedures for 32 element ICP

(Procedures for analysis of the following elements are described below: Ag, Al, As, B, Ba, Be, Bi, Ca, Cd, Co, Cu, Fe, Ga, Ge, K, Li, Mg, Mn, Mo, Na, Ni, P, Pb, Sb, Se, Sn, Sr, Th, U, V, W, Zn.)

Soil samples are processed by the following procedures at Min-en Laboratories Ltd., at 705 W. 15th St., North Vancouver.

After drying the samples at 95 degrees C., soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus 80 mesh fraction for analysis. The rock samples are crushed by jaw crusher and pulverized

by ceramic plated pulverizer.

1.0 gram of the samples are digested for 6 hours with HNO<sub>3</sub> and HClO<sub>4</sub> mixture.

After cooling, samples are diluted to standard volume. The solutions are analysed by Computer operated Jarrell Ash 9000 ICP Inductively Coupled Plasma Analyser. Reports are formatted by routing computer dotline printout.

### 10.3 Statistical Analysis and Interpretation

The results for gold and seven of the elements analysed by ICP (Ag, Pb, Zn, Cu, W, Ba, As) were chosen for statistical analysis by computer. Arithmetic and logarithmic histograms and cumulative frequency plots were calculated and plotted. Where data permitted, the results for an individual element were divided into different populations.

Copies of the computer plots and maps with sample results are included with this report. Possible or probable anomalous zones are outlined on the sample result maps.

#### Gold

Gold values are all low and over half are at or below the detection level (5 ppb). Only four samples are substantially higher in gold than the bulk of the population and can be taken as possibly anomalous. All four are in the 15 to 40 ppb range.

#### Silver

Silver plots show two populations. Ninety per cent of the data is in a population whose upper threshold is 2.65 ppm Ag. Ten per cent of the data is in a population which is probably anomalous and whose threshold is 3.28 ppm Ag. Samples within the mixed population zone (2.65 -3.28 ppm Ag)

can be considered possibly anomalous.

Probably anomalous samples form a band in the north half of the grid, east of the baseline, and another smaller zone in the central west part of the grid. Probably anomalous samples have been contoured with possibly anomalous samples which occur within this zone.

### Lead

Lead plots also show a two population distribution but there is a more even distribution of the data into the two populations. Fifty-five per cent of the data falls into a population whose upper threshold is 150 ppm Pb. Forty-five per cent are in the second population whose threshold is 175 ppm Pb.

The second population samples are found in a north-south zone through the property directly east of the baseline and in much of the south-west part of the grid. The large number of samples within this population suggests that it is the result of a higher background lead content in this area rather than any mineralization. Therefore, this population is only possibly anomalous.

Two samples are substantially higher ( $> 450$  ppm Pb) than the rest of the samples and are definitely anomalous.

### Zinc

Zinc results are similar to lead. As with lead, zinc results fall into two populations with fifty-five per cent in a lower population whose upper threshold is 224 ppm Zn and forty-five per cent in a population whose threshold is 459 ppm Zn. A fair number of samples plot in the zone of mixed populations (224-459 ppm).

The surface distribution of the populations is very similar to those of lead, and as with lead, the higher population is probably due to a

higher background and not any mineralization.

Two samples contain high concentrations of zinc (> 1000 ppm) and are definitely anomalous.

### Tungsten

Tungsten results are mostly in one population with low values that has an upper threshold of 8 ppm. Three samples contain high enough values to be considered a second population and these have been taken as probably anomalous (> 15 ppm). Samples within the mixed population zone (8-15 ppm) can be considered possibly anomalous.

There is a zone of samples in the north-central part of the property which may be anomalous. Other possible anomalous samples occur scattered within the grid.

### Copper

Copper results also show the bulk of the samples with low values (< 60 ppm), a few statistically high values (>75 ppm), and a small number of intermediate values. As the highest value is only 118 ppm Cu, the three highest values are only considered probably anomalous. The intermediate values are considered possibly anomalous.

Higher values are sporadic except for a small zone of probable and possible values on the 800N line east of the baseline.

### Arsenic

Arsenic shows a two population distribution with fifty-five per cent in a population with an upper threshold of 173 ppm and forty-five per cent in a population with a threshold of 240 ppm. As with lead and zinc the higher population is probably due to a higher background arsenic content, and not due to mineralization so this population is only possibly

anomalous. The distribution of this population is similar to that of lead and zinc.

Two significantly higher values ( $> 550$  ppm) occur and these are definitely anomalous.

### Barium

Histograms of Barium results show two distinct populations which do not overlap. On the 200 N Line east of the baseline and on the baseline south of 100 N, most of the samples contain greater than 600 ppm Barium. Except for two samples, all the other samples contain less than 600 ppm Barium. The zone of high Barium values starts where lead, zinc and arsenic values suddenly drop to the south, so this zone is probably due to overall background changes and not mineralization.

Two definitely anomalous samples ( $> 1500$  ppm Ba) occur. One is in the zone of high Barium population, and the other is an isolated anomaly on the 1000 N line.

### 10.4 Conclusions

No significant gold, silver or copper anomalies occur within the Beaver claim soil grid. Results for lead, zinc, arsenic and barium show two populations with a substantial number of results falling into the smaller population. This suggests that the breakdown into two populations is due to a change in background values, or due to wide, weakly mineralized zone.

Higher lead, zinc and arsenic values form a north-south zone just east of the baseline and cover most of the southwest corner of the grid. This zone could be due to a north-south oriented rock unit with higher backgrounds of these elements than the surrounding rock, or possibly a north-south structure which has resulted in an overall increase in these elements. Dispersion down the creek which flows through the center of the

property can account for the extension of this zone westward on the grid. Barium values increase on the 200 N line where lead, zinc, and arsenic values decrease suggesting an inverse relationship to the other elements for barium.

A small number of one sample definite anomalies occur within the grid for lead, zinc, arsenic, barium and tungsten. These are most likely due to small pyrite-galena-sphalerite replacement pods such as those found along the creek during prospecting.

No major gold-silver veining or replacement-mineralization zones were indicated by this geochemical survey.

#### 11.0 RECOMMENDATIONS

Detailed geological mapping should be undertaken on the Beaver claim, especially around anomalies outlined by the geochemical grid, to see if a structural control can be found for the small replacement pods which occur. If a controlling structure can be found, it could be followed in an attempt to find more extensive mineralization.

Due to the extensive overburden cover, geological mapping may require trenching of some of the anomalies.

## 10.0 STATEMENT OF QUALIFICATIONS

I, Hans Smit, of 500 - 151 West Esplanade Street, North Vancouver, British Columbia, do hereby certify that:

I hold a B.Sc. degree in Geology obtained at the University of British Columbia, Vancouver. I have practiced my profession for four years.

I am author of this report, which is based upon work conducted under the supervision of R. Somerville, P. Eng., during the 1985 field season on the Beaver Claims for Erickson Gold Mining Corp. near Cassiar, British Columbia.

H. Smit, B.Sc.

APPENDIX D

Cost Statement - Beaver Claim

# ERICKSON GOLD

September 26, 1985

## BEAVER CLAIM; RECORD OF WORK AND COST STATEMENT

### PHYSICAL:

A 1050 metre baseline extending north from a baseline cut previously on the Bear 1 claim, which lies to the south, and a 940 metre east-west line at 2 + 00N were cut by chainsaw 2 metres wide. The north-south baseline is 350 to 400 metre east of the Hot Lake Road. The east-west line starts at the road and heads east. A map is included which shows the location of the lines. The work was performed, September 3, 4, 5, 6, 1985.

### COST:

4 days x 2 men linecutting @ \$ 150.00/day/man	\$ 1,200.00
8 days chainsaw rental @ \$ 20.00/day	160.00
8 mandays room and board @ \$ 50.00/day	400.00
4 days truck rental @ \$ 50.00/day	200.00
	-----
Total Physical	1,960.00

### GEOCHEMICAL:

The two lines cut were measured by chain. Another 3,900 metre in 4 east west lines extending east from the Hot Lake Road were chained and flagged, but not cut. All lines were then soil sampled at 50 m intervals. The 114 samples obtained were analyzed for Au and multielement ICP. Results will be in a report to follow. The work was performed September 12 (3 men), 13 (2 men), 16 (3 men), 1985.

### COST:

8 mandays chaining/sampling @ \$ 130.00/day	\$ 1,040.00
1 day supervision @ 165.00/day	165.00
1 day drafting @ \$ 140.00/day	140.00
1 day report writing @ 165.00/day	165.00
11 mandays room and board @ \$ 50.00/day	550.00
3 days truck rental @ \$ 50.00/day	150.00
Field supplies/ Drafting supplies	50.00
114 samples analyzed for Au + Multielement ICP @ \$ 12.85/sample	1,464.90
	-----
Total Geochemical	\$ 3,724.90

Erickson Gold Mining Corp.

Box 370, Cassiar, B.C. V0C 1E0  
Telephone (604) 778-7454

PROSPECTING:

Two days, September 12 and 16, were spent prospecting the claim.

COST:

2 days prospecting @ \$ 165.00/day	\$ 330.00
2 days room and board @ \$ 50.00/day	100.00
2 days truck rental @ \$ 50.00/day	100.00
1 sample assayed for Au and Ag	<u>16.00</u>

Total Prospecting	<u>\$ 546.00</u>
-------------------	------------------

Grand Total	<u><u>\$ 6,230.90</u></u>

SHEET INDEX

149	148	147	146	145
144	143	142	141	140
137	136	135	134	133
128	127	126	125	124
117	116	115	114	113

SYMBOLS

- Rock outcrop, area of outcrop, float
- Geological boundary (defined, inferred)
- Bedding (horizontal, inclined, vertical, overturned, dip unknown)
- Schistosity, gressosity, cleavage, foliation (horizontal, inclined, vertical, dip unknown)
- Lineation, axis of minor folds (horizontal, inclined, vertical)
- Drag, fold arrow indicates plunge
- Fault (defined, interpreted)
- Fault, inclined, vertical, relative movement
- Surface joint, horz., inclined, vert., dip unknown
- U/G joint, horz., inclined, vert., dip unknown
- Syncline, defined, approximate
- Anticline, defined, approximate
- Anticline and syncline, overturned
- Intensity (weak, moderate, strong)
- Vein (inclined, vertical, dip unknown)
- Zone of alteration
- Rock sample, X 0.324, 0.15  
Assay Au, Ag, ounce/ton
- Trench
- Adit or tunnel
- Rock dump or tailings
- Shaft, raise, winze
- Diamond drill hole (entering section, leaving section) (on section / plan)
- Contours 2500
- Stream or creek (perennial, intermittent)
- Marsh
- Lake
- Road
