1.0 Summary and Conclusions

Diamond drilling was undertaken in a minimal program of drill testing of Induced Polarization chargeability - resistivity anomalies with coincident soil, rock, and percussion rock chip gold geochemical anomalies in exploration of a highly altered silicified sulphide rich zone on the Toil Mineral Claim during May 1985.

The drill targets were evolved after preliminary surveys of geology, soil geochemistry, percussion drilling and Induced Polarization surveys completed since 1981.

While results were generally negative for drill holes 85-1 - 85-3, hole 85-4 returned anomalous responses over short five foot intervals with the highest being 0.028 Au oz/Ton.

No reasons for the preliminary positive responses obtained for gold in the percussion drill hole program have evolved by recent diamond drilling.

Additional evaluation could relate to drill testing of chargeability high-resistivity high zones containing anomalous gold soil geochemical responses.

2.0 Introduction

Diamond Resources Inc. controls the Toil, ED#1 and ED#2 Mineral Claims located at Five Mile Bay on the west side of Harrison Lake, British Columbia.

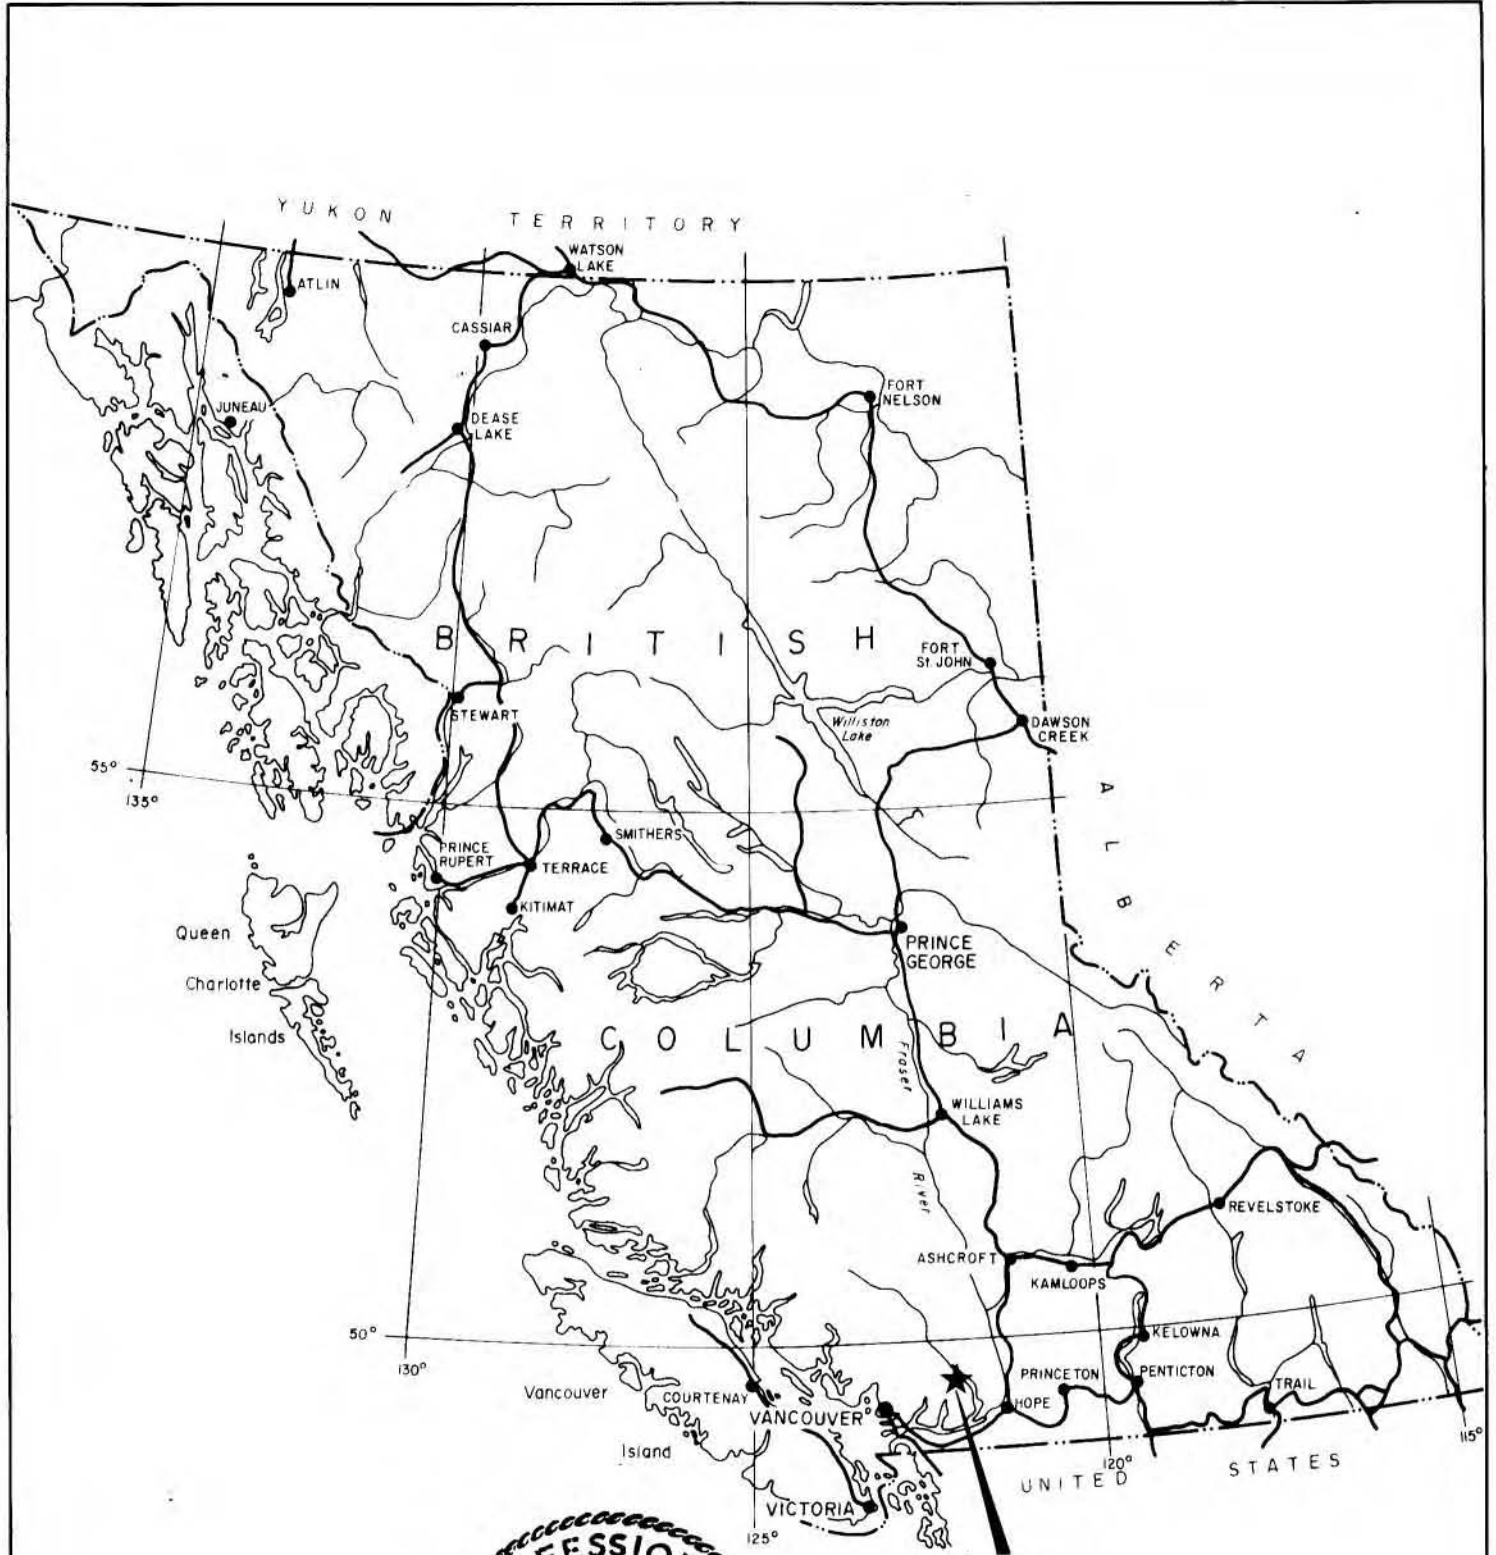

The property was discovered as a result of a reconnaissance prospecting program by J.M.T. Services Corporation stimulated by interest in the area initiated by discoveries at Rhyolite Resources to the south. Positive geochemical soil and rock response for gold related to a highly pyritic zone of rhyolitic volcanics and sericite schists resulted in the location of the claims and subsequent detailed work of geochemistry, geology, percussion and diamond drilling.

The writer initially examined the property on December 19, 1982, completing a report for Diamond Resources Inc. on January 3, 1983. This report is a summary of recent diamond drilling undertaken on geophysical and geochemical anomalies as evolved by work recently completed by J.M.T. Services and Glen White Geophysical Consulting Services Ltd.

The author visited the property to locate drill holes, log and split core on May 9, 15, 16, 22, 23, 26, and 31, 1985.

3.0 Location and Accessibility

The property is situated at Five Mile Bay on the west side of Harrison Lake at approximately 38 miles north of Harrison Mills and 100 miles northeast of Vancouver. The three claims consisting of a total of 37 units are described as being centered at Latitude $49^{\circ}41.25'N$, Longitude $122^{\circ}03'W$, N.T.S. 92G/9 in the New Westminster Mining Division.

Access is via four wheel drive vehicle along the West Harrison Forest access road north of Harrison Mills to Five Mile Bay. Buildings from an abandoned logging camp have been renovated to provide accommodations for exploratory and drilling crews. Much of the access road is in reasonable condition except for the last three kilometers.

The camp is also accessible by float equipped aircraft, helicopter, and a barge service operated by Rivtow from Harrison Hot Springs.

4.0 Claim Information

The property consists of three modified grid system claims.

<u>Name</u>	<u>Units</u>	<u>Record No.</u>	<u>Record Date</u>
Toil	20	1,285 (9)	Sept. 21/81
ED1	12		
ED2	5		

5.0 Physical Features

Elevations on the property range from about 15 to 750 meters above sea level with moderately rugged slopes being deeply incised by easterly flowing streams.

Five Mile Bay is the site of an old logging camp which has in part been renovated to supply housing facilities for exploratory and drilling crews. The claims are covered with second growth vegetation.

A hydro power line crosses the Toil claim along the West Harrison Forest access road.

6.0 History

The history of the area dates to 1897-98 with gold discoveries on the west side of Harrison Lake at Fire Mountain. Small production of about 55 tons is reported from the Providence showing. Additional work was undertaken in 1929 and 1934, with poor success.

During the early 1950's the discovery of copper-zinc sulphides on the southwest side of Harrison Lake was recognized by Cominco geologists as being in a similar geological setting as the Kuroko and Noranda type environments.

The present interest in the area has been initiated by the discovery of gold-silver mineralization at Doctor's Point by Rhyolite Resources.

7.0 Geology

The regional picture of the area has been described by Ray G.E. of the Ministry of Energy, Mines and Petroleum Resources in the "Harrison Lake Project" as follows, "The Harrison Lake fracture system forms a major southeasterly trending dislocation over 100 kilometers in length, which in part passes along, and parallel to, Harrison Lake. The system separates highly contrasting geological regimes (Roddick 1965; Monger 1970). To the northwest, the rocks include well-deformed supracrustals ... as well as highly foliated gneissic rocks and some younger granites. By contrast, the rocks on the southwestern side of the fracture are generally younger, are less deformed, and have suffered lower metamorphic grade; they include a variety of volcanic, volcanoclastic, and sedimentary rocks, as well as intrusives granitic rocks and migmatites".

Gold mineralization is presently known to be found in the Fire Lake and Harrison Lake Groups. On the Diamond Resources property gold soil and rock geochemical anomalies are found in the Fire Lake group of volcanic and sedimentary rocks. These units consisting of green andesitic crystal tuffs, lapilli tuff and breccia with interbedded rhyolitic breccia and argillitic sedimentary rocks have been altered in the central part of the property by silicification and clay-sericite alteration. Pyrite content is high, ranging between 2 - 10%.

Geochemical surveys were completed by J.M.T. Services Corporation as reported on by Mr. K. Wayne Livingstone on December 15, 1984.

7.0 Geology, cont'd.

The geochemistry outlined anomalous zones related to the zone of intense pyrite rich alteration near the shore of Harrison Lake. Percussion drilling was undertaken in an attempt to test geochemical anomalies as related to geology and alteration. Generally, as reported by Mr. Livingstone recoveries were poor, however, several anomalous sections were obtained in various drill holes; i.e. PDH #06 @ 25-30 assayed 0.034 Au oz/T and 150-155, 155-160 returned 0.016 and 0.012 Au oz/T respectively.

A Multipole Induced Polarization Survey was completed on the Toil, Ed #1 and ED #2 during April 17-24, 1985 and reported on by Mr. C. Candy of Glen E. White Geophysical Consulting Services Ltd. on May 4, 1985.

As described by Mr. Candy the apparent chargeability background for the survey area was found to be high indicating a high level of disseminated sulphides. Higher chargeability anomalies were outlined. Resistivity anomalies were also noted. In general, the survey outlined several zones requiring drill testing.

8.0 Diamond Drilling

Diamond Resources Inc. initiated diamond drill testing on the coincident geophysical and geochemical anomalies established in recent surveys. Holes were planned after consultation with

8.0 Diamond Drilling, cont'd.

Mr. C. Candy, B.Sc., of Glen E. White Consulting, with emphasis being on testing chargeability high-resistivity low areas and chargeability high-resistivity high areas with coincident anomalous gold responses either from soil, rock or percussion hole geochemistry. The drill program commenced on May 8, 1985 terminating after the completion of 1,723 feet (525.2 meters) in four holes on May 31, 1985. H.Q. core was taken so as to obtain a larger sample for analysis.

The core was logged by the author and split generally in five foot interval sections for analysis at Chemex Lab Ltd. in North Vancouver for gold and silver. Drill hole data is as follow:

Hole 85-1 - Dip -60° , Azimuth 225° , Final Depth 499.0' or 152.1 m. The hole cut andesitic porphyry, and breccia which was silicified, chloritized, with epidote rich sections containing disseminations, pods and seams of pyrite, generally throughout the whole core. Sulphide content ranged as high as 20%. The hole tested a chargeability high-resistivity low Induced Polarization anomaly with a large gold geochemical anomaly. No gold-silver anomalous areas were obtained in assay results.

Drill logs and sections are appended.

Hole 85-2 - Dip -90° , Final Depth 552.0' or 159.1 m. The hole cut a highly altered silicified zone, at times having intrusive type characteristic, with sections that have schistose and gneissic appearance, all containing varying percentages of sulphides to

8.0 Diamond Drilling, cont'd.

2-10%. No gold-silver anomalous zones were obtained in assay data. The hole was planned to test a chargeability high-resistivity low anomalous area at PDH #10 where the section 70-75' assayed 0.014 Au oz/T.

Hole 85-3 - Dip -60° , Bearing North, Depth 352.0' or 107.3 m. This hole planned to test a coincident chargeability high-resistivity low anomaly was situated near PDH #06 which returned the most positive results of all percussion drill holes. Sections of interest were 0.034 Au oz/T @ 25-30'; 0.010 Au oz/T @ 45-50'; 0.006 Au oz/T @ 85-90'; 0.010 Au oz/T @ 90-95'; 0.016 Au oz/T @ 150-155; and 0.012 Au oz/T @ 155-160'. Diamond drill hole 85-3 returned no sections of interest for gold or silver.

Hole 85-4 - Dip -60° , Bearing South, Final Depth 350.0' or 106.7 m. A coincident chargeability high-resistivity high Induced Polarization anomaly with the largest gold soil geochemical anomaly was tested in this drill hole. The hole cut iron stained, silicified tuffaceous material, andesite, and a fine grained intrusive unit, all generally containing disseminations and seams of pyrite. Anomalous responses were obtained for gold in a few areas: 0.028 Au @ 206.0-211.0; 0.004, 0.002, 0.008, 0.002, 0.004 Au for five foot intervals between 216.0-241.0'.

Hole 85-4 returned the best results for the anomalies tested. The initial three holes tested chargeability high-resistivity low Induced Polarization anomalies while hole 85-4 tested a chargeability

8.0 Diamond Drilling, cont'd.

high-resistivity high anomaly returning the most positive results in gold.

All drill logs are included in Appendix B with individual drill sections and surface location plan.

The core is stored on the property of Bill Rees, Bowen Island

9.0 Comments

Exploratory surveys to date have failed to define zones of economic gold-silver or base metal mineralization, however, strongly anomalous areas have been indicated by rock and soil geochemistry. Geophysical surveys of Induced Polarization indicate a pervasive high apparent chargeability for the immediate area explored which has been substantiated by the amount of sulphides encountered in all drill holes.

Gold-silver responses of an anomalous nature were only obtained in Hole 85-4 where a coincident chargeability high-resistivity high within a gold soil geochemical anomaly was drill tested. Possibly detailed work in such areas would return more positive results.

Respectfully submitted,

Appendix A
Certificate

Certificate

I, John R. Poloni, of 5502 - 8B Avenue, in the Municipality of Delta,
in the Province of British Columbia,

DO HEREBY CERTIFY THAT:

1. I am a Consulting Geologist.
2. I am a graduate of McGill University of Montreal, Quebec, where I obtained a B.Sc. Degree in Geology in 1964.
3. I am a Registered Professional Engineer in the Geological Section of the Association of Professional Engineers of the Province of British Columbia.
4. I have practiced my profession since 1964.
5. I am a Member of the Canadian Institute of Mining and Metallurgy.
6. I have personally visited the Diamond Resources Inc. property on May 9, 15, 16, 22, 23, 26 and 31, 1985.
7. I have no interest in the properties and securities of Diamond Resources Inc., nor do I expect to receive or acquire any.
8. I consent to the use of this report by Diamond Resources Inc. in a submission to the Vancouver Stock Exchange and/or the British Columbia Superintendent of Brokers, and to distribute all or parts of the report to the shareholders or other interested parties provided that the meaning is not altered by partial quotes.

Dated this 13th day of June, 1985.

JOHN R. POLONI P. Eng.
Consulting Geologist
