MAILING ADDRESS BOX 370 PORT HARDY, B.C., VON 2P0.

14777

SUMMARY GEOLOGY (lithology, age, structure, alteration, mineralization, size, and attitude):

The hole intersected the gently southwestward dipping Upper Triassic Vancouver Group succession of, from youngest to oldest, Parson Bay Formation siltstone with thick sections of tuffaceous/porphyritic rocks, Quatsino Formation limestone and interlayered tuffaceous/porphyritic rocks, and Karmutsen Formation basalt... A quartz-feldspar porphyry dyke occurs cutting the Parson Bay rocks. The Quatsino Formation has an apparent thickness of about 45 meters in this location. Sphalerite and chalcocopyrite occur in short sections of garnet skarn in the limestone at contacts between the limestone and the tuffaceous/porphyritic rocks.

## INTRODUCTION

Between 29th of September and the 2nd of October, 1985, a diamond drill hole 202.1 meters (663 feet) in length was drilled on the Bay 70 claim, part of the Central-86 Group of claims. This forms part of the mineral exploration program in the area in 1985.

## PROPERTY DESCRIPTION

The Central-86 group consists of 100 claim/units contiguous to the boundary of the Island Copper mineral leases.

## LOCATION AND ACCESS

The claim group is located in the Nanaimo Mining Division with co-ordinates  $50^{\circ} 37\frac{1}{2}'$  N and  $127^{\circ} 28\frac{1}{2}'$  W. It is located on the NTS map sheet 92L/11W, 12E and borders on the north boundary of the Utah Mines Ltd. mineral leases, some 8 km south of Port Hardy (Map 1). Access is provided part way by paved highway from Port Hardy and the remainder by logging roads suitable for two wheel drive vehicles.

## PHYSIOGRAPHY

The area is in the coastal lowland of the Suquash Basin forming part of the Nahwitti Lowlands of the Central Trough physiographic subdivision. The area is characterized by rounded, gently rolling hills with a maximum relief of about 150 meters and that range in elevations from sea level to about 150 meters.

## PREVIOUS WORK

Recent work by Utah Mines Ltd. has included mapping, Mag/VLF, IP and geochem surveys, and diamond and percussion drilling.

OBJECTIVES

The objective was to collar in the Parson Bay Formation and penetrate through the Quatsino Formation to the Karmutsen Formation to determine the thickness and position of the Quatsino limestone and the extent of any skarn alterations and related mineralization. This forms part of the ongoing program of exploration on claims contiguous to the Island Copper mineral leases.

WORK PERFORMED

Hole: E-65            Core Size: NQ  
Length: 202.1 meters (663 feet)  
Mine Grid Co-ordinates (feet): 18611.6 N, 16591.1E  
Collar Elevation: 101.1 meters (331.8 feet) above sea level  
Inclination: -50°    Azimuth: 018°

Drill core from E-65 was logged, photographed, measured for recovery, RQD (percent of core greater than or equal to four inches in length), and magnetic susceptibility ( $\times 10^{-3}$  CGS units). The core was split and sampled on intervals based on geological contacts with a maximum sample length of 3.0 meters (10 feet), a minimum sample length of 0.46 meter (1.5 feet) and a maximum sample interval of 12.2 meters (40 feet). Samples were assayed for copper, molybdenum, lead, zinc. Gold and silver assays were done as indicated on the assay sheet. Assays were performed in the Island Copper Lab. The core, sample pulps and sample rejects are stored in the upper core shack at the Island Copper Mine site.

The core was logged by the author.

RESULTS

The hole penetrated 8.8 meters (29 feet) of overburden. From 9.4 meters (31 feet) to 45.7 meters (150 feet) the rock consisted of interlayered, thin-bedded, fine grained, altered sediments and coarse ash-lapilli, crystal tuff (porphyry ?). Chlorite-epidote altered augite (?) -feldspar porphyry extends to 77.4 meters (254 feet) with a fault occurring at 50.0 to 50.6 meters (164 to 166 feet) and an associated strong crackle/fracture zone from 45.7 to 62.5 meters (150 to 254 meters). A light green, grey, coarse grained quartz-feldspar porphyry occurs from 77.4 to 92.4 meters (254 to 303 feet) with xenoliths of finer grained granitoid intrusive. Another augite (?) -feldspar porphyry section extends to 110.3 meters (362 feet) and is followed by a chlorite-epidote altered andesite tuff/porphyry (?) to 123.7 meters (406 feet). Yellowish-green, mineralized, epidotized, garnetized, calcareous, thin bedded siltstone and shale grading 1.84% Zn over 6.1 meters (20 feet) extends to 128.0 meters (420') with blue-grey limestone to 135.3 meters (444 feet), yellow-green garnet skarn grading 1.56% Zn over 0.6 meters (2 feet) to 137.9 meters (452.5 feet), and blue-grey limestone to 148.4 meters (487 feet). A greyish-green, carbon stained (bitumen) coarse ash and crystal tuff/porphyry (?) occurs to 159.4 meters (523 feet) with strong sericite alteration over the last 5.5 meters (18 feet). Sphalerite mineralized, yellow-brown garnet skarn grading 6.56% Zn and 0.45% Cu over 1.2 meters (4 feet) is underlain by thin bedded, grey and white, carbonaceous limestone from 160.6 to 163.4 meters (527 to 536 feet) and massive, blue-grey limestone to 171.3 meters (562 feet). A yellow-brown garnet skarn with minor sphalerite and some chalcopyrite grading 0.76% Cu extends to 173.1 meters (568 feet) with a section of epidotized tuff/porphyry (?) to 175.6 feet, reddish-brown garnet skarn grading 0.88% Cu over 2.4 meters (8 feet) to 178.0 meters (584 feet) and another section of epidotized tuff to 18.4 meters (595 feet). From there to the end of the hole at 202.1 meters (663 feet) the rock is a grey-green, porphyritic/amygdular basalt.

The pyrite content is generally less than 1% in the altered sediments, limestone and porphyries, about 2 to 5 percent in the tuff and basalt and 5 to 10% in the skarn sections. Sphalerite and chalcopyrite mineralization is associated with skarn alterations. Silver assays in the skarn sections range from 2 to 8 ppm while gold assays are all less than 0.04 ppm.

## DISCUSSION

The Quatsino Formation has an apparent thickness of about 45 meters (150 feet). The hole was collared in Parson Bay Formation and intersected interlayered sedimentary and volcanic/volcaniclastic rocks to 128.0 meters (420 feet). The augite-feldspar porphyry logged in this hole and hornblende porphyry unit logged in other holes in the area are likely closely related, or the same unit and have been labelled 'PPHB' (mafic porphyry) in the log for consistency. The Quatsino Formation contains both bedded and massive limestone with a tuff layer occurring in mid section from 148.4 to 159.4 meters (487 to 523 feet) and several other thinner layers.

The skarn altered sections occur at the interface between the limestone and volcanic/volcaniclastic units except for the bottom skarn layer where the limestone has been completely altered to skarn.

## CONCLUSIONS

The Quatsino limestone intersected in this hole contains some garnet skarn and limited zinc and copper mineralization. This is probably related to underlying Island Intrusion granitoid intrusives represented in this hole by the quartz-feldspar porphyry dyke.

STATEMENT OF QUALIFICATIONS

I submit that I am qualified to prepare and present this report for assessment credit. My qualifications are as follows:

- 1) I have a B.Sc., (Major Geology) 1971 from McGill University.
- 2) I have been employed as a geologist continuously since June, 1968, and am presently Chief Geologist, Island Copper Mine, Utah Mines Ltd.
- 3) I have been a Fellow of the Geological Association of Canada since 1974.

J.A. Fleming, B.Sc.,  
Chief Geologist.

Island Copper Mine,  
Utah Mines Ltd.

THIS IS SAME UNIT AS ABOVE. THE PROPORTION OF BLK, CHLORITIZED PYROXENE X'AL CLASTS VARIES FROM 5-15% WHILE THE SIZE VARIES FROM .5 MM TO 5 MM. OTHER THAN A FEW LAYERS OF BEDDED SEDIMENT, THE ROCK IS MASSIVE. NOTE THAT THE TUFF LOCALLY HAS THE THIN BEDDED RK AS LAPILLI. SEE SAMPLE @ 86FT.

LARGE LITHIC CLASTS TO 7 CM LONG - FRAGS ARE TUFF AND BDD RK AND SHOW SOME BREAKAGE IN PLACE WITH SLIGHT DISPLACEMENT OF BROKEN PARTS OF CLASTS. SOME DARK, CHLORITIC PYROX ALS ARE UP TO 1 CM LONG. NOTE THE CUSPATE LOOK OF THE DARK CLASTS - SOFT PYROCLAST FALL - AGGLOMERATIC - SEE 53-71 FT. IN HOLE E-86.

SOFT, LIMY, SKARNY LOOKING ALT'D BEDDED ROCK. PYROXENE EUHEDRA TO 2 CM IN LAPILLI CLAST OF PYROX- FELD PORPHYRY.

THE ROCK IS CRACKLED BRECCIATED AND HEALED WITH WHITE CALC AND WT ZEO VEINS 1 MM - 1 CM THK. THE HIGH FRACTURE DENSITY IS DUE TO A FAULT @ 164-166 FT. LATE CARB VEINS ALSO DISRUPTED. A MED-GREEN, PORPHYRITIC APPEARING RK WITH BRONZY, STUBBY, PHENOS TO 1 CM BUT AVERAGING 5 MM COMPOSING UP TO 15% OF RK. SOME SECTIONS HAVE THIN, GREY REACTION RIMS. MOST OF THE PHENOS ARE EUHEDRAL. THIS IS A DISTINCTLY DIFFERENT TEXTURED ROCK FROM THE ABOVE TO 150 FT. THIS IS INCL WITH HBL PORPHYRY. SOME WHITE, ROUND QTZ GRAINS NOTED THRO UNIT PLUS SOME BIOTITE TO 4 MM. BLK GILSONITE AND BRN CARBON STAINED CALCITE IN SECTION.

UTAH MINES LTD., VANCOUVER B.C.

SUMMARY REMARKS

- 0-2 - STICKUP
- 2-31 - OVERBURDEN
- 31-150 - INTERLAYERED THIN BANDED/BEDDED FINE GRAINED ALT'D P.B. SEDS. AND COARSE ASH-LAPILLI-CRYSTAL TUFF. THE LATTER MAY BE A LESS PORPHYRITIC VARIETY OF THE AUGITE-FELD PORPHYRY FROM 35-274 FEET IN HOLE E-66. LESS THAN 10% OF THE SECTION IS THE THIN BEDDED ROCK.
- 150-254 - CHLORITE-EPIDOTE ALT'D AUGITE-FELDSPAR PORPHYRY. A STRONG FRACTURE/CRACKLE ZONE FROM 150-205 FEET IS ASSOCIATED WITH A FAULT AT 164-166 FEET.
- 254-303 - LIGHT GREEN-GREY, COARSE GRAINED QUARTZ-FELDSPAR PORPHYRY WITH XENOLITHS OF FINER GRAINED, LESS PORPHYRITIC GRANITIC INTRUSIVE.
- 303-362 - AUGITE-FELDSPAR PORPHYRY SIMILAR TO SECTION 166-254 FT
- 362-406 - CHLORITE-EPIDOTE-SERICITE ALTERED ANDESITE TUFF. PORPHYRY (?); A VARIETY OF AUGITE-FELD PORPHYRY(?).
- 406-420 - YELLOWISH-GREEN, EPIDOTIZED CALCAREOUS THIN BEDDED, FINE GRAINED SEDIMENTS - ALTERED SILTSTONE-SHALE WITH SOME BROWN GARNET SKARN IN IN PARSON BAY SEDS AND SOME SPHALERITE.
- 420-444 - BLUE GREY LIMESTONE - QUATSINO FORMATION.
- 444-452.5 - YELLOW-GREEN, GARNETIFEROUS SKARN - ALTERED LIMY TUFF (?).
- 452.5-487 - BANDED BLUE-GREY AND WHITE LIMESTONE.
- 487-523 - GREYISH-GREEN COARSE ASH-CRYSTAL TUFF WITH GREASY-BROWN CARBON STAIN FROM 496-505 AND MODERATE SERICITE ALTERATION FROM 505-523 FEET.
- 523-527 - SPHALERITE MINERALIZATION IN YELLOW-BROWN GARNET SKARN ALTERATION AT TUFF-LIMESTONE CONTACT.

## SUMMARY REMARKS

- 527-536 - THIN BEDDED GREY AND WHITE CARBONACEOUS LIMESTONE.
- 536-562 - BLUE GREY, MASSIVE LIMESTONE.
- 562-568 - YELLOW-BROWN GARNET SKARN WITH CPY, SP AND  
PY VEINS.
- 568-579 - EPIDOTIZED TUFF (?).
- 576-584 - REDDISH-BROWN GARNET SKARN WITH PATCHES OF CPY,  
SPHALELITE AND PYRITE.
- 584-595 - EPIDOTIZED TUFF.
- 595-663 - GREY-GREEN, PORPHYRITIC/AMYGDUULAR BASALT -  
KARLUTSEN FM.

Note 1 ft = 0.305 m

SUMMARY REMARKS

- 0-2 - STICKUP
- 2-31 - OVERBURDEN
- 31-150 - INTERLAYERED THIN BANDED/BEDDED FINE GRAINED  
ALT'D P.B. SEDS. AND COARSE ASH-LAPILLI-CRYSTAL TUFF.  
THE LATTER MAY BE A LESS PORPHYRITIC VARIETY OF THE  
AUGITE-FELD PORPHYRY FROM 35-274 FEET IN HOLE E-66.  
LESS THAN 10% OF THE SECTION IS THE THIN BEDDED ROCK.
- 150-254 - CHLORITE-EPIDOTE ALT'D AUGITE-FELDSPAR PORPHYRY.  
A STRONG FRACTURE/CRACKLE ZONE FROM 150-205  
FEET IS ASSOCIATED WITH A FAULT AT 164-166  
FEET.
- 254-303 - LIGHT GREEN-GREY, COARSE GRAINED QUARTZ-FELDSPAR  
PORPHYRY WITH XENOLITHS OF FINER GRAINED, LESS  
PORPHYRITIC GRANITIC INTRUSIVE.
- 303-362 - AUGITE-FELDSPAR PORPHYRY SIMILAR TO SECTION 166-254 FT
- 362-406 - CHLORITE-EPIDOTE-SERICITE ALTERED ANDESITE TUFF.  
PORPHYRY (?); A VARIETY OF AUGITE-FELD PORPHYRY(?).
- 406-420 - YELLOWISH-GREEN, EPIDOTIZED CALCAREOUS THIN  
BEDDED, FINE GRAINED SEDIMENTS - ALTERED  
SILTSTONE-SHALE WITH SOME BROWN GARNET SKARN IN  
IN PARSON BAY SEDS AND SOME SPHALERITE.
- 420-444 - BLUE GREY LIMESTONE - QUATSINO FORMATION.
- 444-452.5 - YELLOW-GREEN, GARNETIFEROUS SKARN - ALTERED  
LIMY TUFF (?).
- 452.5-487 - BANDED BLUE-GREY AND WHITE LIMESTONE.
- 487-523 - GREYISH-GREEN COARSE ASH-CRYSTAL TUFF WITH  
GREASY-BROWN CARBON STAIN FROM 496-505 AND MODERATE  
SERICITE ALTERATION FROM 505-523 FEET.
- 523-527 - SPHALERITE MINERALIZATION IN YELLOW-BROWN GARNET  
SKARN ALTERATION AT TUFF-LIMESTONE CONTACT.

UTAH MINES LTD., VANCOUVER B.C.  
DIAMOND DRILLING

DRILLHOLE/TRVERSE : DDHE-065 (CONTINUED)

## SUMMARY REMARKS

- 527-536 - THIN BEDDED GREY AND WHITE CARBONACEOUS LIMESTONE.
- 536-562 - BLUE GREY, MASSIVE LIMESTONE.
- 562-568 - YELLOW-BROWN GARNET SKARN WITH CPY, SP AND  
PY VEINS.
- 568-579 - EPIDOTIZED TUFF (?).
- 576-584 - REDDISH-BROWN GARNET SKARN WITH PATCHES OF CPY,  
SPHALELITE AND PYRITE.
- 584-595 - EPIDOTIZED TUFF.
- 595-663 - GREY-GREEN, PORPHYRITIC/AMYGDULAR BASALT -  
KARMUTSEN FM.

UNIT, A POORLY EXPRESSED X'AL TUFF. CALL IT PART OF HORNBLENDE,  
(FELDSPAR) PORPHYRY UNIT. ( IE, HBL-AUGITE-FELD PORP)  
SHEARED, BROKEN CONTACT ALONG WITH 20 CM OF COARSE BXX WITH  
80% ANGULAR FRAGS TO 1.5 CM. THE PORPHYRY ABOVE THE CONTACT  
IS LACED WITH WHITE CALCITE VEINLETS 1-3 MM THK ON AVG.

MED GREENISH-GREY, MASSIVE, WEAKLY PORPHYRITIC ANDESITE  
WITH A TUFFACEOUS LOOK. A SIMILAR UNIT LOGGED IN HOLE  
E64 180-193 FEET. POSSIBLY A FINER GRAINED VARIETY OF  
THE PORPHYRY, A PORPHYRITIC ANDESITE OR A ASH-X'AL  
TUFF. THE RK HAS A MOD CHL ALT'N, WEAK SERIC WITH SERIC  
AND EPI AS ENV TO 5 CM (PER SIDE) ON TIGHT FRACTS.  
PYRITE IS MORE ABD IN THIS UNIT THAN ADV. UNITS (ABT 2.5%)  
GILSONITE OR BRN CARBON STAIN COMMON IN CALC-EPI-PYR VEINS.  
PORPHYRITIC ANDESITE (TUFF?)

GREEN, YELLOWISH GREEN BANDED, THIN BOD'S EPIDOTIZED  
CALCAREOUS SEDIMENTS. BRILLIANT RED HEM OCCURS WITH CALC VEINS  
AS SELVEGES AND SELECTIVLY ALT'S BEDS. SOME BROWN GARNET OCCURS  
IN SOME OF THE EPIDOTE BANDS. THE RK IS CUT BY THIN WT CALCITE  
VEINLETS. SPHALERITE OCCURS ALONG THIN BOS.  
CRACKLED SED HEALED WITH BLK CHL.  
ALT'D, THIN BEDDED, CALLAREOUS SEDS.

BLUISH-GREY, FINE GRAINED, PARTLY CRYSTALLIZED LIMESTONE  
WITH UP TO 2% GREYISH-BLACK CHERTY NODULES AND BANDS  
GENERALLY WITH SOME DEFORMATION OF THE NODULES. THE  
DARK COMPONENTS AVERAGE 1 CM IN DIA AND UP TO 3 CM LONG
