**SUMMARY**

This report summarizes results of geochemical work on the Flathead 1-12 claims, Fort Steele Mining Division, B.C. Work on five separate grids (A, B, D, E, F) was carried out between June 16th and August 6, 1986 and consisted of grid preparation by chain and compass, prospecting, geological mapping and collection of 545 soil samples and 63 rock samples. Samples were analyzed for 10 elements by ICP methods by Acme Analytical Laboratories Limited of Vancouver, B.C.

## INTRODUCTION

This report presents the results of the 1986 work program done on the Flathead 1-12 claims, Fort Steele Mining Division, British Columbia. The program, designed to follow up prospecting work done in 1985, comprised soil sampling on five grids, geological mapping and prospecting.

## LOCATION AND ACCESS

The Flathead mineral claims are situated in southeastern B.C. in the vicinity of Trachyte Ridge and Howell Creek (Figure 1). The property is situated approximately 30 kilometres southeast of Fernie, B.C. and 20 kilometres north of the British Columbia-Montana border at latitude 49°10'10" and longitude 114°32'50". The area is within the MacDonald Range of the Rocky Mountains between elevations 1,400 metres and 2,200 metres in moderate to steep terrain. Much of the area is above treeline and ridges are generally rounded to flat upland plateaus.

Access to the claims is by logging roads leading from the locality of Morrissey, 13 kilometres south of Fernie on Highway 3, for a distance of about 70 kilometres following Morrissey Creek, Lodgepole Creek, Harvey Creek and the Flathead River. Helicopters are necessary for access to the higher elevations and to all of the western half of the claims, notably Grids A and F (see below).

## CLAIM INFORMATION

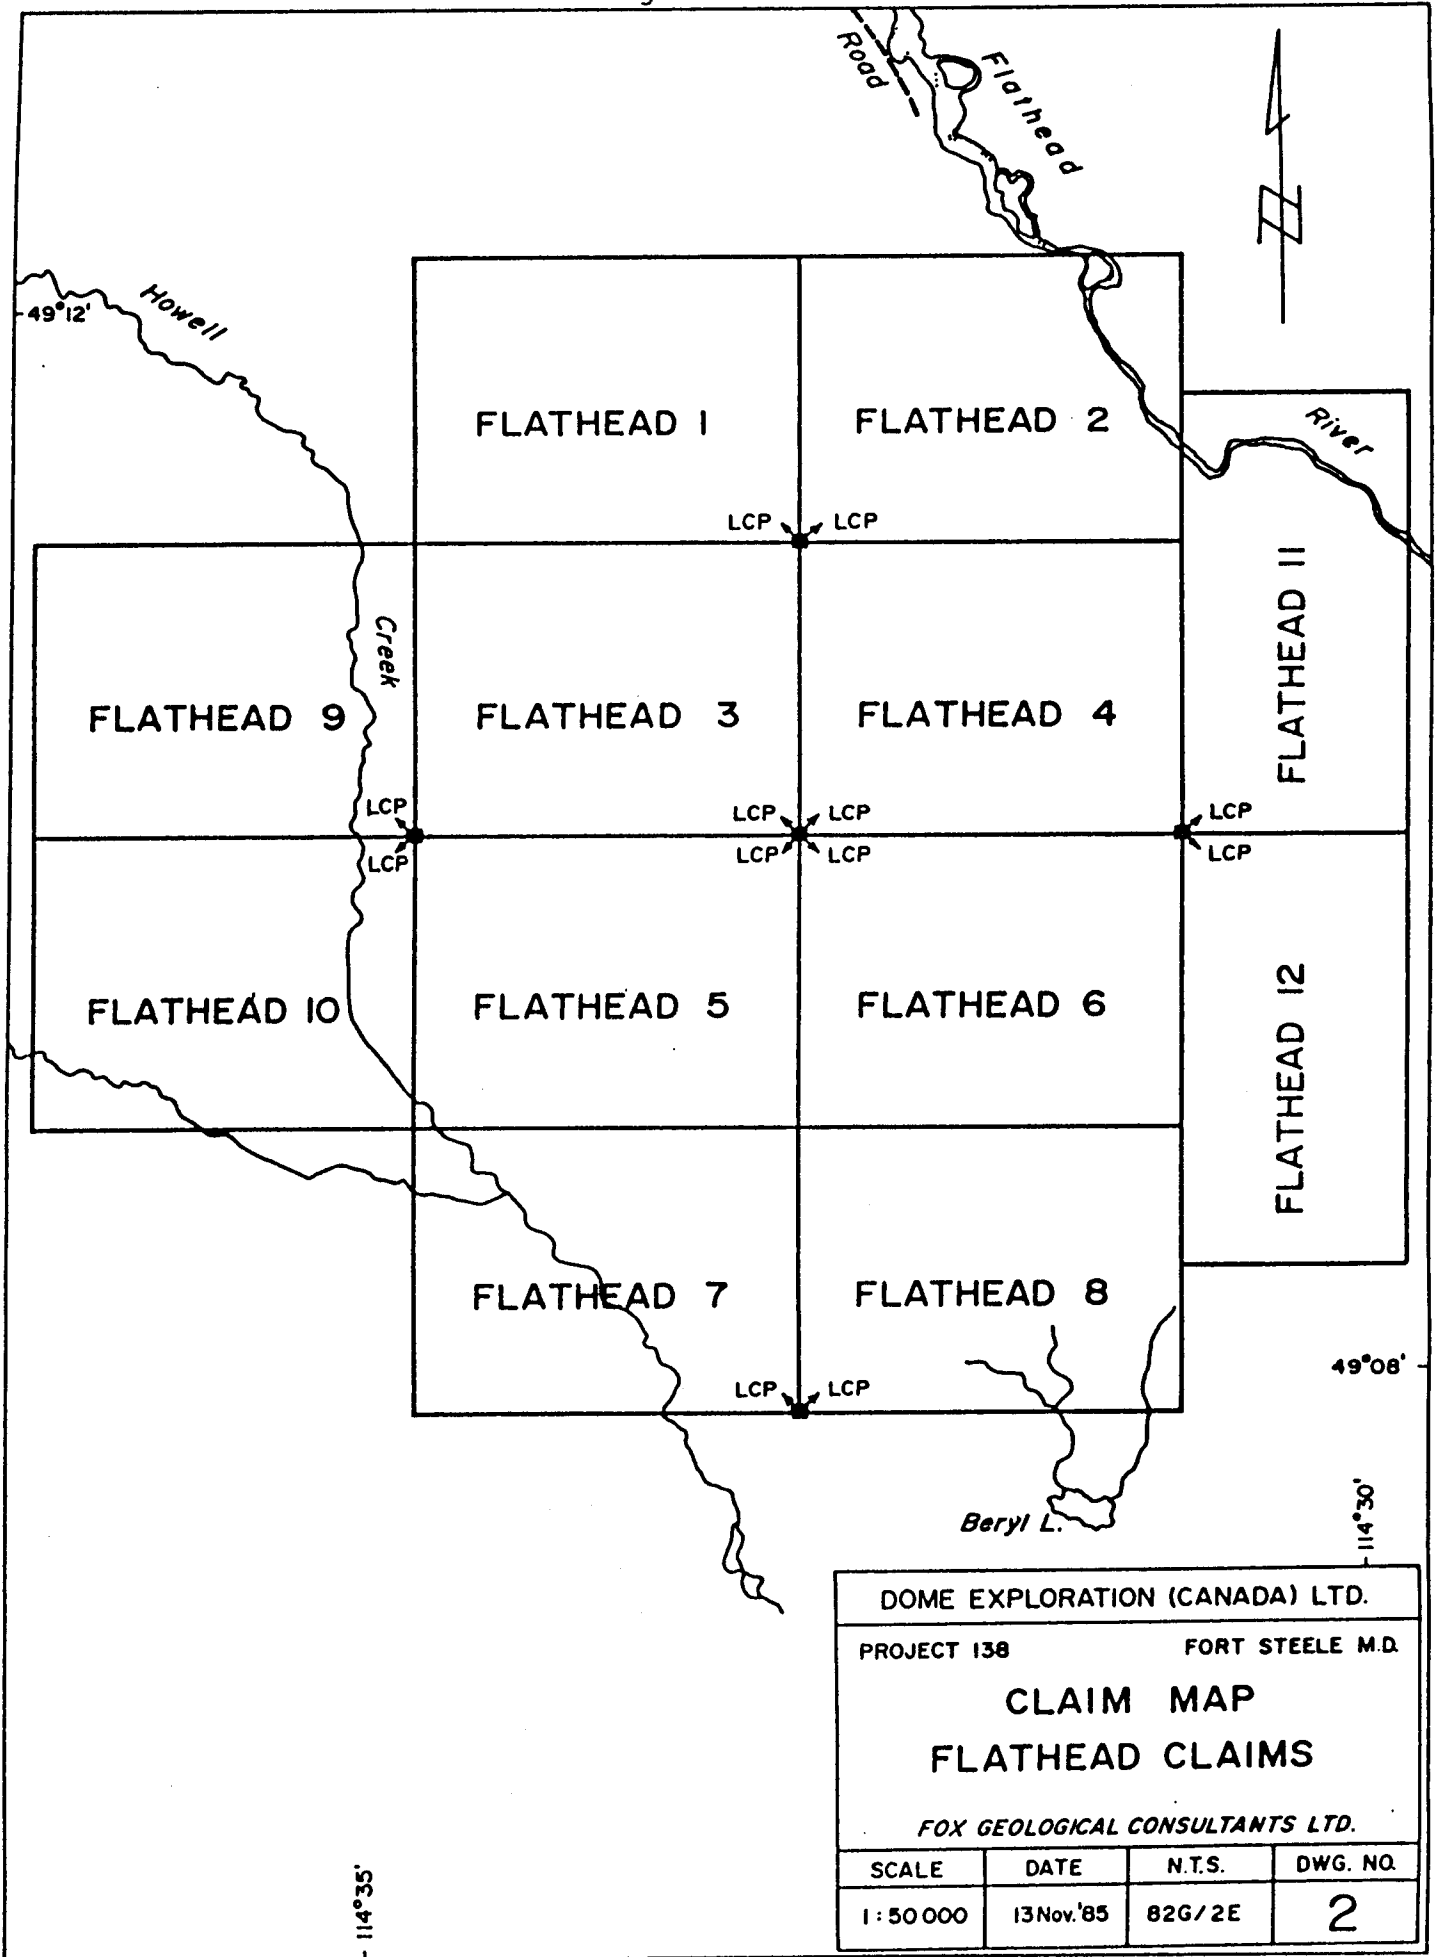

The Flathead 1-12 mineral claims (Figure 2) consist of 236 units and are situated within the Fort Steele Mining Division on NTS Map Sheet 82G/2E and 1W. The expiry dates shown below assume that current work will be accepted for assessment purposes.

CLAIM NAME	RECORD NO.	UNITS	GROUP	EXPIRY DATE

## 1986 WORK PROGRAM

The 1986 prospecting program was done between June 16th and August 6th, 1986. A base camp was established on Harvey Creek near its confluence with the Flathead River some five kilometres north of the Flathead claim block.

Two target area (Grids A and B) identified in the 1985 prospecting program were examined in detail. Work included extending the soil grids, prospecting and hand trenching.

In addition, three new targets were briefly examined by preliminary soil sampling and limited prospecting.

Grid systems (Figure 3) were established by chain and compass methods and soil samples collected from 'B' horizon soil materials (where possible) or a mixture of soil and colluvial matter at 50-metre intervals along grid lines spaced either 100 metres or 200 metres apart. Both soil and rock samples were analyzed for 10 elements by ICP methods by Acme Analytical Laboratories in Vancouver, B.C. Analytical results are included in Appendix I. Regional geology, A-grid geology and results for copper (ppm) and arsenic (ppm) are plotted on Figures 4 through 16.

## GENERAL GEOLOGY

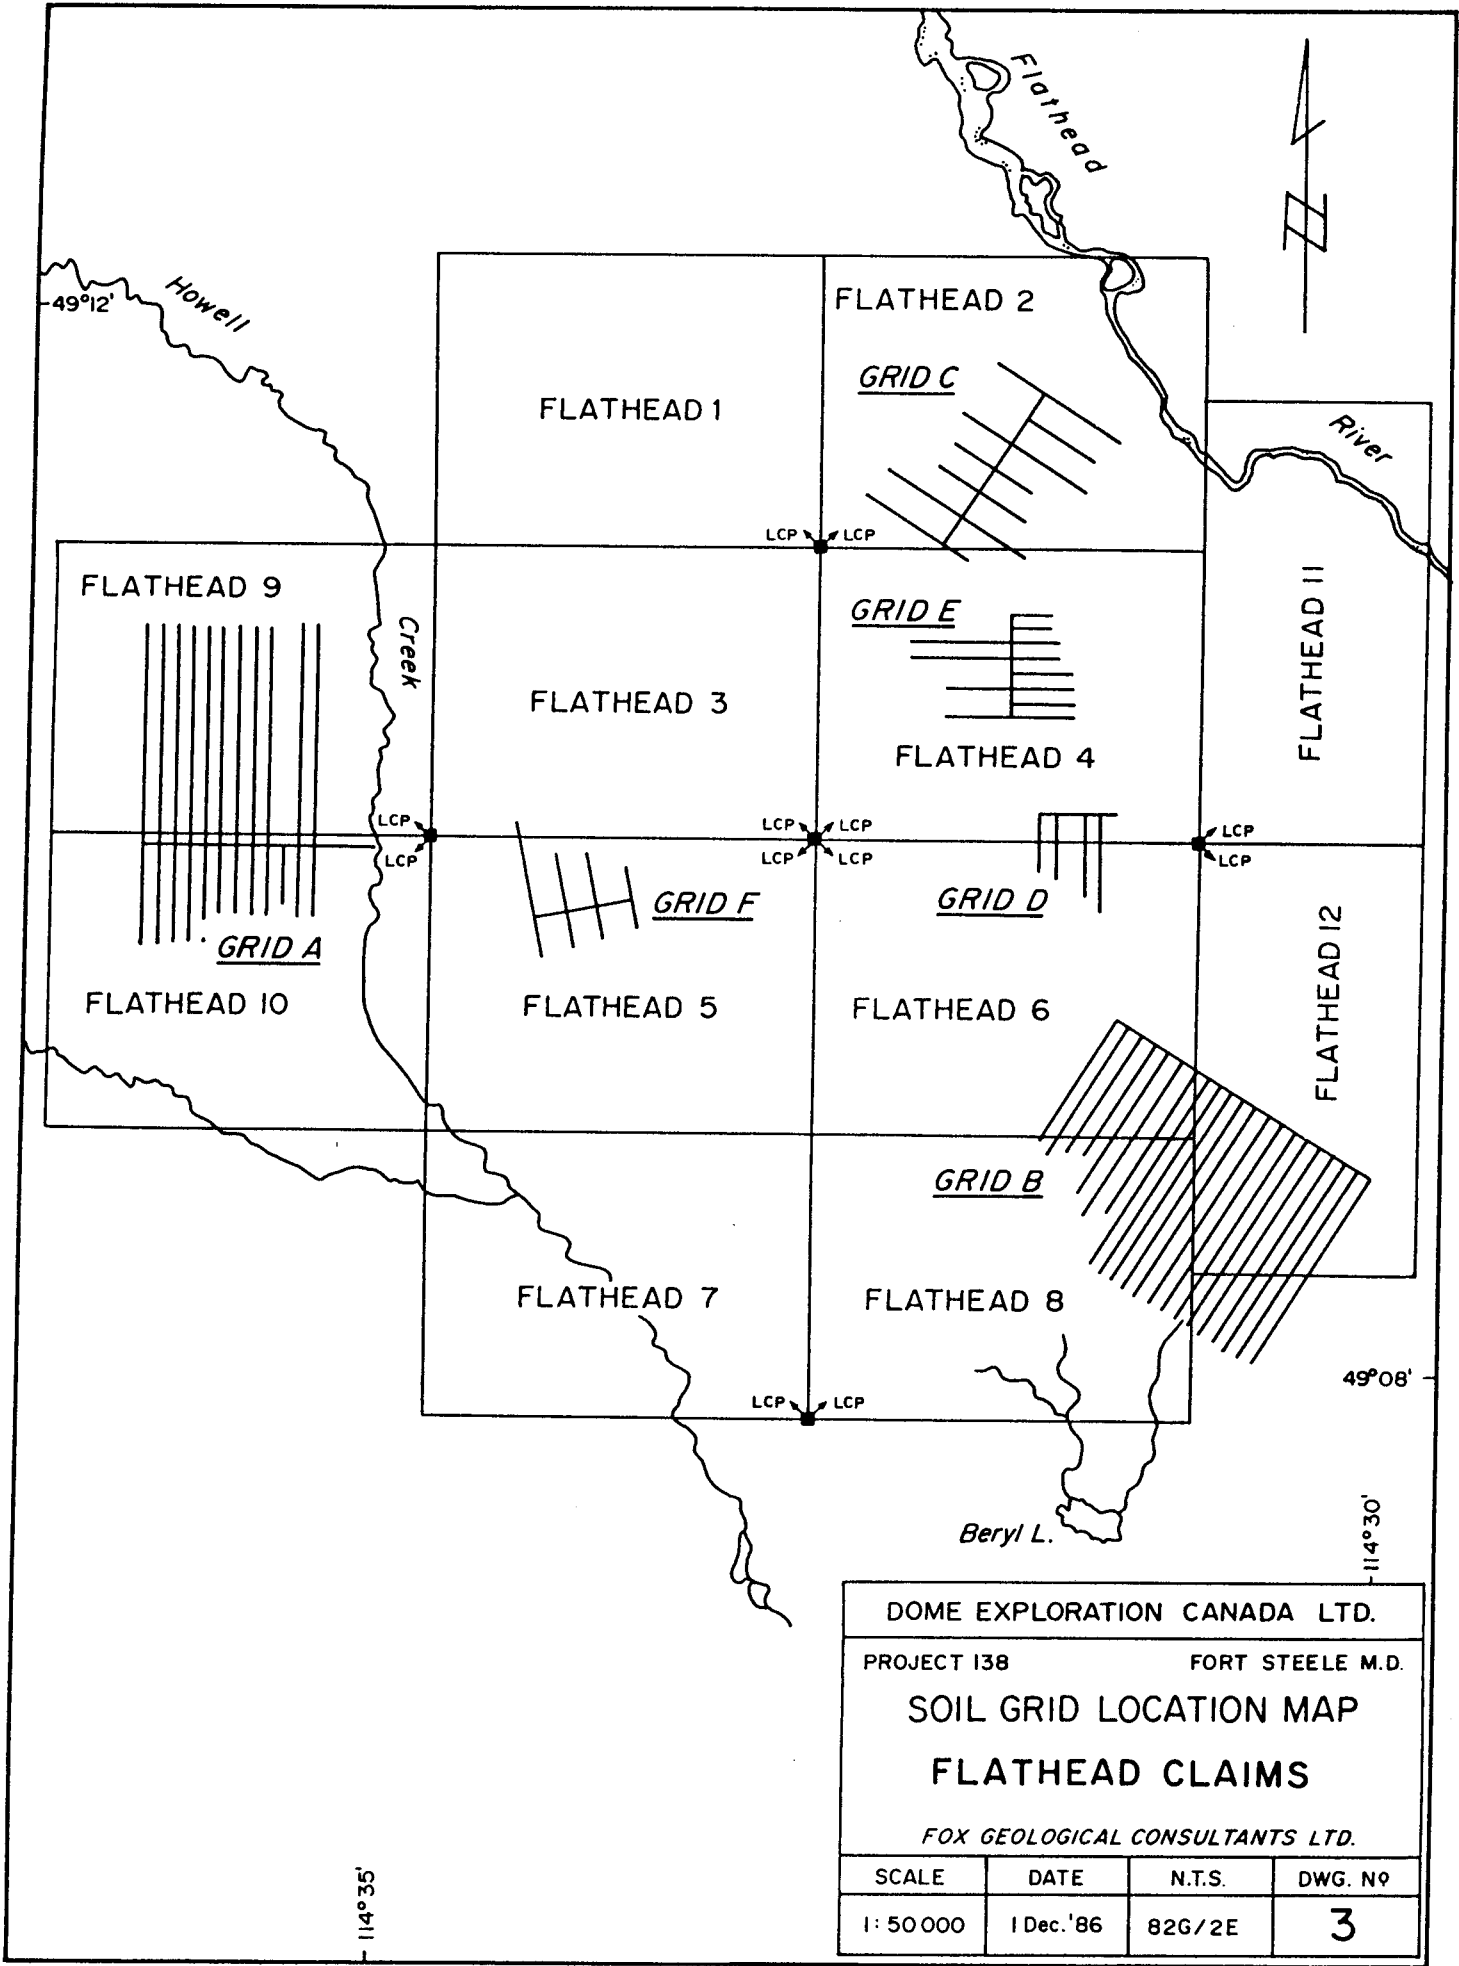

The regional geology of the Flathead area taken from mapping by P.B. Jones and incorporating 1985 detailed mapping by Dome Exploration (Canada) Limited appears in Figure 4. The Trachyte Ridge area is underlain by a thick series of Devonian (Palliser Formation) and Mississippian (Exshaw, Banff, Livingstone, Mt. Head and Etherington Formations) limestones, dolomites and black shales and by Permo-Pennsylvanian (Rocky Mountain Formation) quartz arenites and dolomitic sandstones. Numerous small Cretaceous stocks of trachyte and syenite composition have intruded and locally altered the enclosing sedimentary strata.

## RESULTS

### Grid A

Grid A was established over a large body of trachyte west of Howell Creek and centred on the Flathead 9 and 10 claims. One hundred and seventy-eight soil samples and 55 rock samples were collected. Access to the grid was by helicopter.

The sampling grid is established on a large intrusion of fine to medium grained porphyritic to massive trachyte. The stock consists of euhedral orthoclase phenocrysts (25%) enclosed by smaller aegerine, plagioclase, orthoclase and minor melanite (andradite garnet) phenocrysts in a variable light to dark, fine grained to aphanitic groundmass. Rare isolated quartz veins to 2cm and small breccia zones of rock fragments set in a massive garnet groundmass are also present. Limonitic, siliceous, clay altered fracture zones transect the stock in several places.

The trachyte stock is enclosed by coarse crystalline, skeletal calcarenites of the Mississippian Mount Head and Livingstone Formations. Within these rocks, an aureole of coarse equigranular marble has been developed for a distance of about 100 metres around the stock. Small bodies of calc-silicate skarn were also found along the contact with the stock.

Soil geochemical patterns for arsenic and copper are shown on Figures 6 and 7 respectively. Arsenic exhibits strong anomalies along the flanks and contact zones of the trachyte stock. This is in contrast to copper which has its highest values in the centre of the grid, located over the trachyte stock.

Rock geochemical results are plotted on Figure 8 with rock descriptions accompanying the analytical results in Appendix I. Copper anomalies are associated with disseminated malachite in recrystallized limestones adjacent to the trachyte stock. Low contrast arsenic anomalies are associated with narrow clay-altered, siliceous fracture zones in the centre of the stock.

### **Grid B**

Grid B was established over a small plug of trachyte in the southeast corner of the Flathead claim block (Figures 3 and 9). Five soil lines, numbered 80N to 84N were added to the northwest end of the 1985 soil grid. In addition, soil profiles and limited rock sampling were done on selected sample sites from the 1985 grid. In total, four rock samples and 83 soil samples were collected. Results for copper and arsenic are plotted on Figures 10 and 11. Values are uniformly low throughout the grid area.

### **Grid D**

Grid D was also established over a small plug of trachyte on the eastern side of the Flathead claim block (Figure 3). Sixty-four rock samples were collected along four soil lines. Results for copper and arsenic are plotted on Figure 12. Low contrast coincident copper/arsenic soil anomalies occur in the northern ends of lines 101E and 102E.

### **Grid E**

Grid E was established over a small clay-altered trachyte plug just northwest of Grid D (Figure 3). Three rock samples and 150 soil samples were collected. Results for copper and arsenic are plotted on Figures 13, 14 and 15.

Copper exhibits a strong geochemical pattern centred on the trachyte stock (Figure 13). It is in part coincident with a moderate arsenic soil anomaly. Rocks in the area consist of pyritic intrusion breccia and isolated quartz veins often with traces of chalcopyrite. Deep soil samples and rocks were collected from prospect pits in an area of intense clay alteration (Figure 15). Copper values are elevated with respect to the surface soil samples. Arsenic values are uniformly low.

## Grid F

Grid F was also established over a small trachyte stock located immediately east of Howell Creek. One rock sample and 70 soil samples were collected. Values are uniformly low for copper but are slightly enhanced for arsenic at L100E and 104+50N (Figure 16).

## CONCLUSIONS AND RECOMMENDATIONS

Significant copper and arsenic values both in soil and rock chips warrant further evaluation on Grid A. In addition, soil anomalies on Grid E and the results of deep soil profile sampling warrant follow up work.

Additional trachyte stocks exist on the property and should be examined by preliminary soil sampling and prospecting.

## DISBURSEMENTS

Project disbursements tabulated by the various grouping configurations are given in Table I. Total costs for the 1986 program are \$33,600.00. Work was paid for by Dome Exploration (Canada) Limited, owner of the claims.

**CERTIFICATE**

I, Robert S. Cameron, of the City of Vancouver, B.C. do hereby certify that:

1. I graduated from Carleton University in 1981 with a Bachelor of Science degree in geology.
2. I have been practising my profession as a geologist since 1981.
3. I have worked on the Flathead claims for the period specified in this report.

ANALYTICAL RESULTS

by

Acme Analytical Laboratories Ltd.  
852 East Hastings Street  
Vancouver, B.C.

GEOCHEMICAL ICP ANALYSIS

.500 gram sample is digested with 3ml 3-1-2 HCL-HNO<sub>3</sub>-H<sub>2</sub>O at 95 degrees Celsius for one hour and is diluted to 10ml with water. This leach is partial for MN, FE, CA, P, CR, MG, BA, TI, B, AL, NA, K, W, SI, ZR, CE, SN, Y, NB and TA. AU detection limit by ICP is 3ppm. Sample type: soils -80 mesh. AU analysis by AA from 10 gram sample.

LEGEND

- QUATERNARY**  
 Qal Modern alluvium
- TERTIARY**  
 Tku Kishenehn Fm.; conglomerate
- CRETACEOUS**  
 +Ki+ Trachyte, syenite  
 Kjsp Jasperoid; granular to cherty silicified limestone
- PERMO-PENNSYLVANIAN**  
 Prm Rocky Mountain Fm.; quartzitic and dolomitic sandstone
- MISSISSIPPIAN**  
 Mr RUNDLE GROUP  
 Me Etherington Fm.; thinly bedded limestone, minor dolomite, green shale  
 Mmh Mount Head Fm.; limestone, dolomite, locally carbonaceous  
 Ml Livingstone Fm.; coarse crystalline calcarenitic limestone  
 Mb Banff Fm.; impure limestone, minor black shale  
 Mex Exshaw Fm.; fissile black shale
- DEVONIAN**  
 Dp Paliser Fm.; limestone, minor dolomite

- Geological contact; defined, approximate, assumed
- Fault; defined, approximate, assumed (circle indicates downthrow side)
- Thrust fault
- Area of almost continuous outcrop, sub-outcrop
- x Outcrop
- 44 Bedding
- + Anticline
- + Syncline
- Ch - chaledony, Sk - skarn, Lim - limonite, Ga - garnet, Qtz - quartz vein, bx - breccia
