SOIL GEOCHEMISTRY AND
PRELIMINARY GEOLOGICAL MAPPING
LYNN AND ALAMO MINERAL CLAIM GROUP
SLOCAN MINING DIVISION
THREE FORKS, B.C.

SUMMARY

Soil geochemistry has confirmed and expanded silver and zinc anomalies which were located in earlier surveys, and has detected additional anomalies. Rocks are favourable to host economic concentrations of precious and base metals. Detailed soil geochemistry and dozer and backhoe trenching should be undertaken to explore for bedrock sources of metals. A budget of \$35,200 in Phase 2 and a total of \$115,200 in two Phases is estimated.

INTRODUCTION

The property is located on the western end of London Ridge, immediately east and northeast of the confluence of Seaton and Kane creeks. Highway 31A, which joins New Denver and Kaslo, passes through the southern part of the claim block. New Denver is located approximately 9 km to the west. A logging road extends from Highway 31A northerly onto an abandoned railway grade, westerly along the grade, and thence northerly to within 100 m of the north boundary of the Alamo claim. Elevations range from 760 m (2500') at Three Forks to 1585 m (5200') on London Ridge.

Record data of the claims are as follows.

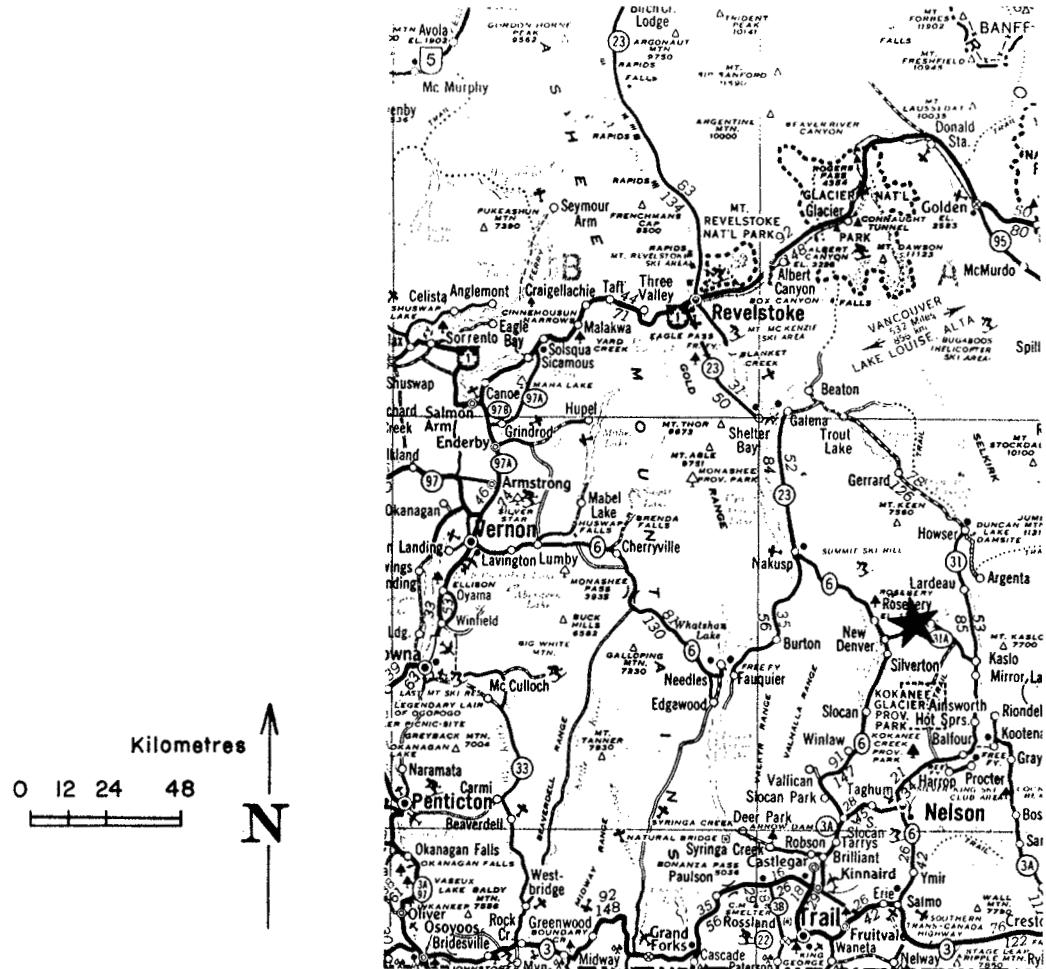

<i>Claim Name</i>	<i>Size in Units</i>	<i>Record Number</i>	<i>Record Date</i>
Lynn	6	4257(3)	March 21, 1984
Alamo	9	4746(7)	July 9, 1985
Alamo 2	2	4759(7)	July 30, 1985
Alamo 3	2	4786(9)	September 3, 1985

A total of 27.75 km of grid was established. Base line trends north-south along the west side of the claims with cross lines oriented east-west. Line spacing is 100 m with sample sites at 50 m intervals.

HISTORY

Old pits or adits have been noted in four locations on the property. An adit at the north side of Highway 31A on the Alamo 2 claim was mapped by Lynn (Tully, 1985, fig. 12-5). A trench or possibly caved adit portal is located at 1+00S 12+00E of the present grid. Shallow cuts or trenches are present to the east and west of the access road in the vicinity of 4+50S 8+00E, and 4+50S 11+00E. An adit at 17+00S 2+55E, some 8 m in length, was not shown on previous maps.

Reconnaissance soil geochemistry along the railroad grade and along an existing logging road was commenced by Snell (1980). A geochemical survey was

completed the following year over the area then held by a previous Alamo claim, now included within the subject property (Snell, 1981). Preliminary geological mapping and soil sampling within four of the 1981 anomalies was completed by Lynn (Tully, 1985).

No history of production is known, but only a very small tonnage could have been extracted. The Alamo Mine quoted in earlier reports (Tully, 1984, 1985) is situated 5 km southwest of the southwest corner of the claim group. Confusion in location is caused by an error on topographic and claim maps which shows the Alamo millsite 0.5 km east of Three Forks, in the southwest corner of the claims, whereas it is in fact situated at the junction of Howson and Carpenter creeks, some 1.5 km west of Three Forks.

GEOLOGY AND MINERALIZATION

The claims are underlain by clastic sediments of the Triassic-Jurassic Slocan Group. Granitic dykes, possibly coeval with the Nelson batholith, intrude the sediments. Foliation trends northwesterly, with variable dips which are predominantly westerly.

Grey and smoky quartz without visible sulphides form a train of float which extends northeasterly (upslope) and southwesterly at 1+00S 12+00E. Veinlets and small veins of quartz in granitic float also form part of the dispersion pattern. One float sample (MIN-2) contains 9.4 ppm Ag. It is possible that the quartz may be related to the bedrock source of a silver anomaly in soils.

White and grey quartzite exposed in outcrop and in an adit 8 m long at 17+00S 2+55E contains abundant disseminated pyrite.

Rusty gossan, probably after pyrite in sediments, is present near the portal of an adit on the north side of Highway 31A (Snell, 1981).

A rhyolite dyke with quartz veinlets which contain silver-lead mineralization (Snell, 1981) is located to the east of the present claim group.

SOIL GEOCHEMISTRY

A narrow, elongate spade was used to collect a total of 527 soil samples from 30-45 cm below organic debris. In general, the survey provided better resolution of silver and zinc anomalies which were detected in previous work.

The following table displays statistical data concerning metal abundance derived from lognormal probability plots. Years of soil sampling results over Slocan Group rocks have been compiled into this information.

	Ag ppm	Pb ppm	Zn ppm
Background	<2.3	<38	} Possibly two populations
Threshold	2.3 to 4.9	38 to 150	
Anomalous	>4.9	>150	>980

Silver

On line 00 from 10+00E to 16+00E a broken pattern of threshold to sub-anomalous values occurs in sandy soil near the crest of London Ridge. It is possible that additional sampling to the north would produce a continuous anomaly. No outcrop was observed. Samples taken near old trenches at 1+00S 12+00E have only background amounts of silver. The train of quartz in float, one sample of which (MIN-2) contains 9.4 ppm Ag, does not appear to be reflected in the soil geochemistry on line 1+00S.

A single sample anomalous value of 5.6 ppm at 2+00S 10+50E is coincident with anomalous zinc.

Threshold to anomalous values on the flat area in the vicinity of 4+00S 8+00E to 7+00S 10+00E have no obvious explanation. A low ridge with rounded granitic boulders and angular argillite fragments trends northwesterly with its northern margin at 5+00S 8+40E. Otherwise the silver values occur on a featureless expanse of overburden; lead and zinc values are not elevated.

A cluster of threshold silver values occur on a steep westerly slope from 10+00S 2+00E to 12+00S 1+50E. Scattered outcrops of argillite and shaly argillite were observed but no source of the metal values was visible.

A single sample value of 6.0 ppm Ag at 10+00S 10+50E has been duplicated in other surveys. Because of proximity to the railroad grade contamination is suspected, but additional investigation is required.

Subanomalous values at 17+00S 0+50 to 1+00E and 18+00S 1+00E are unexplained. Argillite float is present on a steep slope on the south side of Carpenter Creek.

Zinc

Two clusters of zinc anomalies each have one associated anomalous silver value. On lines 1+00S 10+50E to 11+00E and 2+00S 10+50E values to 1250 ppm Zn occur with 5.6 ppm Ag. No outcrop could be found, but float is predominantly argillite with lesser amounts of granitics. At 9+00S 11+00E and 10+00S 9+50E to 11+00E zinc values to 1550 ppm with one silver of 6.0 ppm define an anomaly upslope from the railroad grade. Argillite outcrops along the roads and to the northwest of the high metal values but no bedrock source was observed.

Single sample highs at 2+00S 4+00E (3250 ppm Zn) and 2+00S 5+00E (1200 ppm Zn) may be derived from shale which outcrops nearby. Similarly, values at 4+00S 11+50E, and 12+00S 4+50E and 13+00S 4+50E may be related to inherent zinc content of shale or shaly argillite. Black graphitic shale in float underlies the eastern ends of lines 17+00S and 18+00S where zinc levels are elevated. One anomalous sample beside the railroad grade at 8+00S 21+00E is attributed to contamination.

Lead

No clearly anomalous lead values were obtained.

CONCLUSIONS

Elevated metal values occur in seven locations where the source could be economic concentrations of silver and/or zinc in bedrock.

<i>Coordinates</i>	<i>Metals</i>
00 10+00E to 16+00E	Ag
2+00S 4+00E & 5+00E	Zn (Ag?)
2+00S 10+50E	Ag + Zn
4+00S 7+50E - 7+00S 10+00E	Ag
10+00S 2+00E - 12+00S 1+50E	Ag
10+00S 9+50E to 11+00E	Ag + Zn
17+00S 0+50E - 18+00S 1+00E	Ag

RECOMMENDATIONS

Phase 1 geochemistry as recommended by Tully (1985) is completed and documented in this report.

Phase 2

Detailed soil geochemical sampling on 25-metre centres should be completed around each of the zones listed above. Dozer-backhoe trenching should be undertaken on anomalies which are considered significant after results of soil geochemistry are evaluated.

Phase 3

Diamond drilling may be required on selected targets.

COST ESTIMATE

Phase 2

Soil sampling	\$ 2,500
Analyses	3,000
Dozer/backhoe trenching	15,000
Geological supervision	6,000
Vehicle, fuel	1,500
Room, board, supplies	500
Engineering	1,000
Report	<u>2,500</u>
Contingencies @ 10%	32,000
Total, Phase 2	35,200
	\$ 35,200

Phase 3

A budget for 500 metres of diamond drilling in short holes should be available.

Diamond drilling totalling 500 metres at \$100/metre might be required.
A budget of \$80,000 should be available.

\$ 80,000

Total, Phases 2 and 3	\$115,200
-----------------------	-----------

Results of Phase 2 should be compiled into an engineering report; continuance to Phase 3 should be contingent upon receiving favourable conclusions and recommendations from an Engineer.

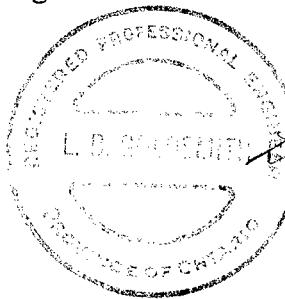

Respectfully submitted,

ENGINEER'S CERTIFICATE
LOCKE B. GOLDSMITH

1. I, Locke B. Goldsmith, am a Registered Professional Engineer in the Province of Ontario and the Northwest Territories, and a Registered Professional Geologist in the State of Oregon. My address is 301, 1855 Balsam Street, Vancouver, B.C.
2. I have a B.Sc. (Honours) degree in Geology from Michigan Technological University, a M.Sc. degree in Geology from the University of British Columbia, and have done postgraduate study in Geology at Michigan Tech and the University of Nevada. I am a graduate of the Haileybury School of Mines, and am a Certified Mining Technician. I am a Member of the Society of Economic Geologists, the AIME, and the Australasian Institute of Mining and Metallurgy, and a Fellow of the Geological Association of Canada.
3. I have been engaged in mining exploration for the past 27 years.
4. I have authored the report entitled, "Soil Geochemistry and Preliminary Geological Mapping, Lynn and Alamo Mineral Claim Group, Slocan Mining Division, Three Forks Area, B.C.", dated November 3, 1986. The report is based upon fieldwork and research supervised by the author.
5. I have no ownership in the property, nor in the stocks of Minotaur Explorations Ltd..
6. I consent to the use of this report in a prospectus, or in a statement of material facts related to the raising of funds.

Respectfully submitted,

Locke B. Goldsmith

A P P E N D I X

Gold F.A.-A.A. Combo Method ppb:

For low grade samples and geochemical materials, 10 gram samples are fused in litharge, carbonate and siliceous flux with the addition of 10 mg of Au-free Ag metal and cupelled. The silver bead is parted with dilute HNO₃ and then treated with aqua regia. The salts are dissolved in dilute HCl and analyzed for Au on an atomic absorption spectrophotometer.

Detection limit: 5 ppb

Copper, Lead, Zinc, Silver ppm:

1.0 gm sample is digested with perchloric-nitric acid (HClO₄-HNO₃) for approximately 2 hours. The digested sample is cooled and made up to 25 mls with distilled water. The solution is mixed and solids are allowed to settle. Copper, lead, zinc and silver are determined by atomic absorption techniques. Silver and lead are corrected for background absorption.

Detection limit: Copper, Zinc - 1 ppm
Silver - 0.2 ppm
Lead - 2 ppm

Arsenic ppm:

A 1.0 gm sample is digested with a mixture of perchloric and nitric acid to strong fumes of perchloric acid. The digested solution is diluted to volume and mixed. An aliquot of the digest is acidified, reduced with KI and mixed. A portion of the reduced solution is converted to arsine with NaBH₄ and the arsenic content determined using flameless atomic absorption.

Detection limit: 1 ppm
