**SECTION A    INTRODUCTION**

## **INTRODUCTION**

---

---

Eight percussion holes were drilled on the Nickel Plate Property between August 15 and 29, 1986. The drill sites were located on the Bulldog and Terrier claims and totalled 727 meters in cumulative length. Purpose of the drilling was to test the mineralization potential of a proposed rock waste dump site.

### **Location, Access and Physiography**

The Nickel Plate Property is located on the southern border of the Interior Plateau, approximately 240 kilometers east of Vancouver near Hedley, British Columbia.

The Property is accessible via 13 kilometers of public road which joins Highway 3 approximately 1.5 kilometers east of Hedley and winds up the south and southeastern slopes of Nickel Plate Mountain. The Property is also accessible via a well-maintained gravel road from the Apex Mountain ski resort, 13 kilometers to the east. Apex is reached from the City of Penticton by 34 kilometers of paved road.

The Property covers an area of varied topography where the rolling upland plateau has been deeply incised by the Similkameen River and tributary creeks. Elevations range from 520 meters at Hedley in the Similkameen Valley to over 1850 meters at the top of Nickel Plate Mountain and to 2048 meters at the top of Lookout Mountain. The steepest slopes occur in the Windfall Canyon section, above Hedley Creek. Here, precipitous cliffs, steep ridges and talus slopes plunge over 1200 meters to the valley floor. Elsewhere, slopes are more subdued and easily traversable.

The climate is dry with precipitation in the order of 28 cm per year in the valley and with twice that amount recorded at the higher levels of the plateau. In the winter months snow can reach depths of 60 to 120 cm on Nickel Plate Mountain and snow flurries can occur anytime of the year at the higher elevations. Temperatures commonly vary from 10 to 40°C in summer and from 0° to -30°C in winter.

The lower slopes are typically open and grassy or sparsely wooded with pine and aspen. The higher slopes are generally well timbered with pine, fir, spruce, aspen and balsam. Slopes with southern exposure have moderate to sparse tree cover with many open areas of grass and sagebrush.

#### Claims and Ownership

The Nickel Plate Property is made up of 95 Crown-granted mineral claims (91 owned and 4 leased), two mineral leases totalling 26 claims, 6 reverted Crown-granted and 11 located claims of 38 units. These 161 claims units are essentially a contiguous circular mass and cover 2324 hectares (see Figure 1).

The surface rights are also held to 13 of the Crown-granted mineral claims as well as two other parcels. Surface ownership totals 197 hectares.

A summary of property holdings is appended in Section E.

#### History and Previous Work

The mining history of the Hedley area dates back to the 1860's when placer gold was discovered near the mouth of Hedley Creek. The first mineral claims were staked in 1894 but it wasn't until 1887 that prospectors discovered the oxidized outcrops of gold-bearing beds on Nickel Plate Mountain.

In 1904 the Yale Mining Company commenced production from claims presently held by the Company. By 1909, 167,000 tons averaging 0.696 ounces of gold per ton had been milled. Hedley Gold Mining Company took over in 1909 and operated continuously until 1931 when all the then-known ore reserves were exhausted and the mine was closed.

After extensive geological study and related exploration had established, Kelowna Exploration Company Limited (later known as Kelowna Mines (Hedley) Limited), maintained the Nickel Plate property in continuous commercial production from 1934 until 1955. In that year operations were again suspended as a result in part of the steady increase in the cost of labour and supplies in relation to the fixed price of gold. All the equipment and buildings were removed. The mineral claims and surface rights were transferred from Kelowna to Burden Investors Services Inc. in 1965 by way of a distribution of assets on liquidation.

In all, the Nickel Plate property was in near continuous production for some 47 years and produced 3,273,807 tons of ore grading 0.442 ounces of gold per ton yielding 1,448,460 ounces of gold.

#### **Recent Exploration**

Following the cessation of production, Burden granted an option to Dundee Mines Limited who undertook a program of eight diamond drill holes some distance from the former workings. From 1967 to 1971 the property was under option to Giant Mascot Mines Limited which carried out surface and underground exploration, also in areas away from central workings. In 1971, a subsidiary of Giant Mascot (now Mascot Gold Mines Limited) acquired the property and carried out minor exploration work up to 1979.

In 1979, with the dramatic increase in the price of gold, Mascot commenced the rehabilitation of the upper haulageways and conducted a sampling program within the more accessible stopes.

In late 1980 a surface diamond drilling program totalling 14,480 feet in 97 holes was initiated within the Sunnyside and Nickel Plate Systems, and was followed by an extensive underground drilling program through the winter of 1981-82 aggregating an additional 32,486 feet in 377 holes in 12 areas. During this period some 272 feet of drifting was carried out in the newly discovered Sunnyside 250 Zone.

In the summer and fall of 1982 a surface program of geologic mapping, surface trenching, sampling and a limited amount of surface and underground diamond drilling was undertaken to locate surface expressions of ore bodies and to obtain a greater understanding of the structures in areas previously known. This surface work located the new Silverside Zone, added dimensions to the known Sunnyside No. 1 Zone and expanded the information base in the Bulldog No. 3 Zone.

From April 1984 to January 1986, Mascot Gold Mines carried out comprehensive exploration programs involving 51,700 meters of surface and underground drilling.

A production decision was made in late 1985 and construction is currently underway. Open pit reserves total 7.1 million short tons grading .150 oz Au/ton.

### Geology

The area is underlain by sedimentary and volcanic rocks of the Upper Triassic Nicola Group. These have been intruded by stocks, sills and dykes of quartz diorite and diorite of the Hedley Intrusions dated at 180 ma. Later intrusions of granite and granodiorite formed the Cahill Creek Pluton which underlies Nickel Plate Mountain and has been dated at 145 ma.

Near the top of Nickel Plate Mountain, interbedded siltstone and impure limestone of the Nicola Group has been altered to sulphide-bearing skarn. Gold occurs as minute blebs associated with a bismuth telluride (hedleyite) within and around grains of arsenopyrite and gersdorffite. Electrum also occurs associated with later stage intergrowths of pyrrhotite, chalcopyrite and sphalerite.

**SECTION B SUMMARY OF WORK**

## SUMMARY OF WORK

---

---

### Percussion Drilling

Between August 15 and 29, 1986, eight percussion holes totalling 727 meters were completed on the Nickel Plate property. Four holes were located on the Bulldog claim and four on the Terrier claim. Hole locations are plotted on Figure 3.

Tonto Drilling B.C. Ltd., was contracted to carry out the drilling utilizing a TH60 Ingersoll Rand truck mounted rig equipped with down-hole hammer and dual wall pipe for reverse circulation drilling. A support truck equipped with a water tank and an extra drill pipe attended the rig. Holes, 13 cms in diameter, were drilled vertically to depths ranging from 87 to 91 meters. Air circulation was used as much as possible, but water circulation was required for approximately 50% of the drilling. Casing was set in holes to prevent caving of loose fill and overburden.

Sampling procedures were standarized as much as possible and every attempt was made to minimize handling and contamination. Drill cuttings were carried by hosesline from the pipestem to a cyclone sampler attached to the drill truck. A three-tiered Jones splitter was set up under the cyclone and a 1/8 split was obtained every 3 meters (10 feet) and transferred to Hubco Sentry 10 x 14 inch sample bags. The hole was cleaned after every 3 meter run to ensure a complete sample. While drilling dry, a door at the base of the cyclone kept the sample confined until the run was completed. Drilling with water however required a continuous flow and the door was left open. Immediately after sample collection the Jones splitter was cleaned with a high pressure air hose.

For visual logging purposes, a 40-dram vial sample of sieved, +2 mm rocks chips was taken from the back-up sample. Logs are appended on Section G.

Samples for assay were shipped via transport to Ecotech Labs Ltd. in Kamloops. A total of 221 samples were fire assayed for Au.

Laboratory reports are appended in Section F, drill logs in Section G. Drill hole locations are shown on Figure 2. Total cost of the drilling amounted to \$24,711.75. Laboratory assay costs totalled \$2,185.00.

#### Discussion of Results

The drill holes intersected a sequence of altered, dark calcareous argillites intruded by diorite porphyry sills. Hole G86-38 encountered skarn beds near surface with gold-bearing sulfide zones. The interval from 1.5 to 9.1 meters (7.6 meters width) averaged .082 oz Au/ton.

#### Conclusions

No economic mineralization was found to exist under most of the proposed rock waste dump site within 100 m of the surface. Hole G86-38 located on the north edge of the site intersected gold mineralization near surface assaying .082 oz Au/ton over 7.6 meters. Further drilling is recommended to outline this mineralization.

Respectfully submitted

R.G. Simpson  
Project Geologist

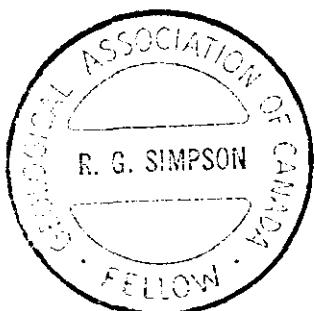

**SECTION C STATEMENT OF QUALIFICATIONS**

STATEMENT OF QUALIFICATIONS

RONALD G. SIMPSON

=====

1. Attended the University of British Columbia and graduated in May 1975 with an honours B.Sc. degree in Geology.
2. Is a fellow of the Geological Association of Canada.
3. Has carried out his profession continuously since 1975 and has been employed as a project geologist with Mascot Gold Mines Limited since August 1984.

Respectfully submitted,

A handwritten signature in black ink, appearing to read "R.G. Simpson".

R.G. Simpson
