OBJECTIVE OF PRESENT WORK

The objective of present work on the Stemwinder Property is to evaluate the economic potential of auriferous ore shoots on the HW³ Vein (North Vein) and also to provide underground access to auriferous ore shoots on the Main Vein which could be of sufficient size and frequency and ore grade to provide for milling and/or leaching (see page 4 Fletcher report 1986). (For geology see page 3 Fletcher report 1986).

CONCLUSION

Work carried out to date is providing information on potential ore shoots within the main target areas on the North Vein. Drill hole 82-9 (11' .268 Au) is approximately 400' (123m) from the drift face at the time of this report. Eventual information will provide sufficient data necessary to determine mine development costs and will assist in information necessary for metallurgical studies involving the recovery of gold and silver.

SUMMARY

Following recommendations of D.M. Fletcher, P.ENG., which forms an integral part of this submission, providing property geographic, physiographic, location, access, geology, index map showing property and regional physiography, as well as historical information.

Up to February 24th, 1987, work has been completed to include setting up the full facilities of an exploration camp consisting of trailers, work shop, installation of telephones and electrical power, powder magazine and construction of a waste dump area, all located near the portal site of the Brown Bear Claim.

The main thrust of the Exploration program has been to follow Stage I of D.M. Fletcher, P.ENG. report dated June 28, 1986, slashing old adit and drift 200' (61.53 m), advancing exploration drift to follow HW₃ Vein (North Vein) 1100' (335m). Work is continuing at the time of this report. (See enclosed map [Index map 3-D] progress report Stemwinder Property.

QUALIFICATIONS

This Technical Progress Report has been prepared by Management from information provided by D.M. Fletcher, who is a registered Professional Engineer in the Provinces of British Columbia and Ontario and who graduated from the University of British Columbia in 1956.

QUALIFICATIONS - MANAGEMENT

John W. Carson, President of Highland Valley Resources Ltd. has successfully completed several mineral identification and geology courses presented by the Department of Energy, Mines and Petroleum Resources.

Refer to Mr. George Addie, district Geologist, Department of Energy, Mines and Petroleum Resources, Nelson, British Columbia.

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

The Stemwinder vein system has produced 28,000 tons of ore, grading 0.17 oz. gold per ton and 1.9 oz. silver per ton. Recent drilling (1982-1984) has increased the resource potential of the property and located exploration target areas of better grade mineralization. As the recurrence of better grade mineralized shoots is yet to be determined, underground exploration drifting as herein outlined is recommended initially. This work would explore those areas with higher grade diamond drill intercepts, determine continuity, frequency, size and regularity of precious content. Information necessary to estimate mine development costs, to determine the dilution factor and to assist in the metallurgical recovery of gold and silver would be provided.

This report outlines the extent of underground drifting required and sets forth cost estimates for a two stage program to explore the Stemwinder vein system. This staged work North Drift (Stage I) and Decline (Stage II) achieves exploration assessment by drifting along the two principal veins (Main Vein and HW Vein) toward a target area indicated by surface drilling. A third stage program connecting the North Drift and Decline headings to the old Stemwinder workings is depicted in the attached maps; however, no cost estimate for this work is provided.

Surface trenching to expose concealed portions of the Stemwinder vein system for sampling is warranted.

INTRODUCTION

This report is based on my examination of the Stemwinder property in company with Mr. J.W. Carson on June 23, 1986. The purpose of the examination was to advise on the merit of driving exploration drifts to test persistence of gold content between diamond drill intercepts positioned astride the Stemwinder vein system.

Background data for this report was secured from:

1. Fairview Mining Co.- maps (plans and sections covering Stemwinder workings) and file data,
2. Diamond drill reports provided to Fairview Mining Co. by Cominco during an option period covering the property 1982-1984,
3. Minister of Mines and Petroleum Resources reports covering the years 1900 to present,
4. Geological Survey of Canada, Memoir 179 (1935).

LOCATION, ACCESS AND FACILITIES

The Stemwinder property is located 5.5 miles west of the town of Oliver, B.C. and can be reached by paved and all weather gravel road which climbs from 1000 feet above sea-level at Oliver to 3000 feet elevation in the vicinity of the property. The topography astride the property is rolling with steep slopes. The area is moderately wooded with alder, birch, pine and underlying brush.

Electric power lines pass through the property being explored. Water supply, subject to prior rights, exists in Reed Creek and the Okanagan River. The towns of Oliver and nearby Penticton can supply housing and other requirements such as timber supply and machine repair facilities essential for mine operation.

An attached Plate 1 shows the position of the property in relation to the road access system and other supports.

CLAIMS

Highland Valley Resources Limited holds under an option agreement, the following contiguous Crown Grants:

Wynn M	Lot 554
Stemset	Lot 218
Brown Bear	Lot 385
Stemwinder	Lot 384
Gunsite	Lot 258

Additional claims may be added.

HISTORY AND PAST PRODUCTION

The Fairview gold camp (Fairview, Stemwinder and Morning Star properties) was discovered in the 1890's. Prior to 1908, estimated early production from quartz veins positioned on the property and adjacent claims, was 30,000 tons, grading 0.17 oz. gold per ton and 1.9 oz. silver per ton. The camp remained dormant during the period 1908 - 1933, but production was reactivated for short periods since 1934. Accumulated production from the Stemwinder property and the two adjacent main centres in the camp totals 521,300 tons at an average grade of 0.122 oz. gold per ton. A summary of this production is abbreviated as follows:

	Tons	Gold Oz./ton	Silver Oz./ton
Stemwinder Mine	28,000	0.17	1.9
Fairview Mine	485,000	0.112	1.4
Morning Star Mine	8,300	0.56	1.27
Total	521,300	0.12	1.42

Diamond drilling footage at the Stenwinder property totals 14,000 feet in 33 holes and has outlined a complex auriferous vein system comprised of the Main Vein, the HW Vein (North Vein) and the FW Vein (South Vein). These three veins extend through the property and can be traced over a strike length of 4,400 feet. A listing of the holes with significant auriferous intercepts, and a location plan of hole positions is attached. (see Plates 3A, 3B and 3C)

Highland Valley Resources Ltd. acquired an option on the property in March 1986, and is currently rehabilitating the old Centre Adit workings on the Brown Bear claim.

GEOLOGY

The Stenwinder property lies on a northwest trending belt of metasedimentary rocks bounded between the Oliver granite to the northeast, and the Fairview granodiorite to the southwest. This metasedimentary sequence which dips (50-60) to the northeast, is approximately three miles long and varies from one half to one mile in width from northwest to southeast. Quartz veining hosting gold mineralization is conformable to the dip of the sediments and occurs along at least two miles of the belt. The belt averages 1,000 feet in width and is comprised of a sequence of different sedimentary rock types. Recent drilling (1982 to 1984) indicates three distinct lithologic units; an upper green argillite, an underlying central quartzite with a lower dark argillite footwall. The gold-bearing productive quartz veins, generally are positioned within and conformable to the central quartzite unit sandwiched between the overlying and underlying argillites. These auriferous quartz veins, the HW (North Vein), the principal Main Vein, and the underlying FW (South Vein), appear to form a gold-bearing system commencing at the Fairview Mine crossing the Stenwinder property, and extending southerly to the Morning Star Mine, distance of 6,400 feet.

DEVELOPMENT AND TONNAGE POTENTIAL

Plan maps (Plate 3A, 3B and 3C), longitudinal section (Plate 4) together with underground maps (Plates 5 and 6) provided herein, depict the extent of the workings on the Stenwinder vein system as well as the configuration of diamond drill holes. Appendix I lists drill intercepts yielding gold values along the vein system.

Although precise grade and tonnage estimates are not available on the Stenwinder property, previous work conducted by Cominco suggests an extension of their Fairview ore shoot on to the northwest limits of the Stenwinder property. The resource potential extending on to the Stenwinder property suggested by drilling, indicates a possible 700,000 tons having a "best guess" grade similar to previous Fairview production of say, 0.11 oz. gold and 1.2 oz. silver per ton. Old reports (1936) summarizing potential adjacent to the Stenwinder Incline, indicate an additional 15,000 tons having a weighted average grade of 0.164 oz gold per ton.

Recent diamond drilling (1982 - 1984) suggest the presence of higher grade ore shoots positioned between the Stemwinder Incline and the Centre Adit - North Drift. Assay data on this target area, penetrated by drill holes is listed in Appendix I. Drilling results on the Main and HW (North Vein) not only indicate that both veins are very persistent, but suggest that shoots of good grade ore occur (e.g. 82-9 yields 11.0 feet 0.268 oz. Au, 0.547 oz. Ag; 82-8 yields 1.5 feet 0.518 oz. Au, 9.64 oz. Ag; 83-5 yields 2.5 feet 0.318 oz. Au, 3.68 oz. Ag; and 83-4 yields 2.5 feet 0.445 oz. Au and 0.42 oz. Ag). These auriferous shoots could have some recurrent order and could be of sufficient size and frequency to sweeten background auriferous quartz to milling or leaching grade. The continuity of these veins is a most favourable feature and further underground exploration work is recommended.

RECOMMENDATIONS AND COST ESTIMATE

A two staged exploration approach to assess and to define the position and limits of higher grade gold-bearing shoots located between the old Stemwinder workings and the Centre Adit is recommended. Each stage involves underground exploration drifting with limited underground lateral diamond drilling to determine the tenor of adjacent veins. In addition, surface trenching and sampling along the Main Vein and the HW (North Vein) between the Stemwinder Incline and the Fairview property is warranted and should be completed in the first stage. A third stage program connecting the North Drift (Stage 1) and Decline (Stage 2) headings to the old Stemwinder workings at the 200 level is depicted in Plates 3B and 4; however, no cost estimate is provided.

Stage I North Drift Extension Continuation of current work along the North Drift to intersect higher grade gold penetrated by Diamond Drill Holes 83-4, 82-8 and 82-9 should proceed. Plates 3C, 4 and 6 indicate the position of the drift. Cost estimate is as follows:

1. Centre Adit - North Drift		
1000 feet @ \$267/ft.		\$ 267,000
2. Underground diamond drilling		
1500 feet @ \$ 20/ft.		30,000
3. Surface trenching		
Stemwinder Incline to Fairview boundary		10,000
4. Assaying 340 samples @ \$26 each		
(includes freight, sample preparation)		8,800
5. Metallurgical Testing		7,000
6. Geological Control, Surveying		
\$4,500/mo. x 3 months		13,500
7. Equipment Rental, fuel		
4 x 4 truck, \$900/mo. x 3 months		2,700
fuel		1,000
8. Supervising , Reports		10,000
		<hr/>
	Total	\$ 350,000

Stage II Exploration Decline Commencement of this stage is dependent upon obtaining encouraging results from Stage I. Underground work involves the driving of an exploration decline beginning on the surface exposure of the Main Vein and proceeding southerly along this vein to intersect higher grade shoots penetrated by surface drilling. Plates 3B and 4 depict the location of the decline. Costs are estimated to be:

1. Decline Collar preparation road access, timber, etc.	\$ 20,000
2. Exploration Decline 8 ft. x 8 ft	240,000
3. Underground diamond drilling 1,000 feet @ 20/ft.	20,000
4. Assaying 225 samples @ \$26 each	5,800
5. Metallurgical Testing	7,000
6. Geological Control, Surveying \$4,500/mo. x 3 months	13,500
7. Equipment Rental, fuel 4 x 4 truck, \$900/mo. x 3 months fuel	2,700 1,000
8. Supervision, Reports	10,000
Total	<u>\$ 320,000</u>

METALLURGY

The Stenwinder vein system contains pyrite, with some zinc and sparse galena in a gangue of quartz and sheared wall rock. Metallurgical testing will assist in determining subsequent treatment to estimate the cost effectiveness of milling and/or leaching to extract precious metal content.

CERTIFICATION

I, D. M. Fletcher, of the City of Vancouver, Province of British Columbia, hereby certify as follows:

1. I am a geological engineer residing at 3908 West 31st Avenue, Vancouver, B.C.

2. I am a registered Professional Engineer in the Provinces of British Columbia and Ontario. I graduated from the University of British Columbia in 1956.

3. I have practiced my profession for thirty years.

4. I have no interest, direct or indirect, in the Stemwinder group of claims, or in the securities of Highland Valley Resources Limited, or its affiliates, nor do I expect to receive any interest.

5. The information in this report is derived from engineering data obtained from Fairview Mining Company files, the British Columbia Minister of Mines and Petroleum Resources Reports, and from examination of the claim group.

6. I consent to the use of this report in connection with prospectus or in a statement of material facts relating to the raising of funds for this exploration project; provided, however, no portion may be used out of context in such a manner as to convey a meaning differing materially from that set out in this report.

Dated at Vancouver, B.C., this 28th day of June, 1986.

D. M. Fletcher
D. M. Fletcher, P.Eng.
