Introduction

General

Corporation Falconbridge Copper owns in excess of 500 claim units in the Barriere area of the Kamloops Mining Division, British Columbia. For administration purposes these properties have been divided into several claim groups. This report presents the results of diamond drilling carried out in October 1986 on the SC Group.

Location and Access (Figure 1)

The claim group is located on a plateau between the North Thompson River and North Barriere Lake. The group is bounded by latitude $51^{\circ}16'$ and $51^{\circ}18'$ and longitude $119^{\circ}58'$ and $120^{\circ}02'$ (Figure 1).

Access is available from Highway 5 via the Barriere Lakes Road and smaller logging access roads from there.

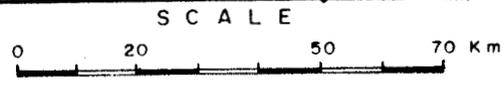

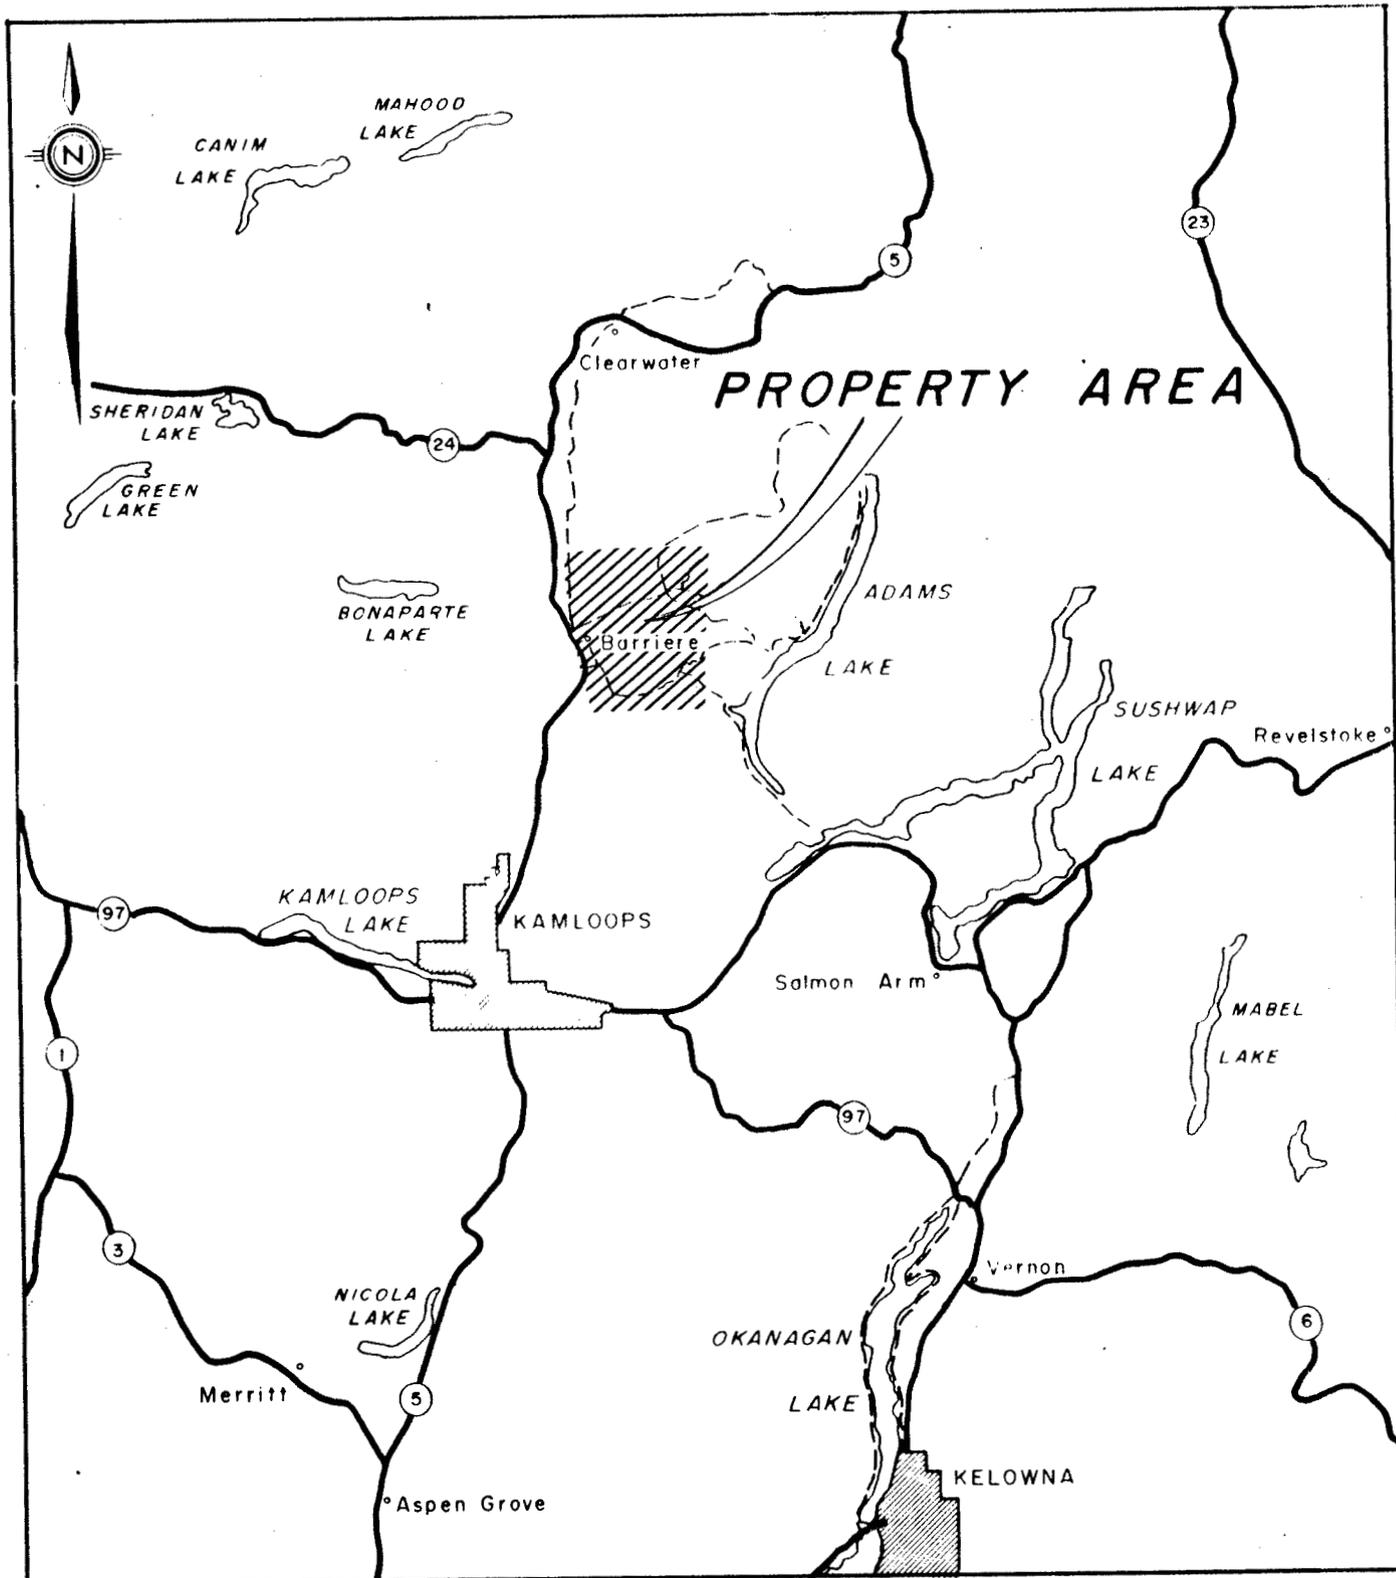

Physiography

The property lies between the elevations of 1000 and 1500m on the eastern edge a plateau with steeply incised creeks draining the level top. The area is covered by heavy spruce forest with active logging in many areas.

The climate is moderate with temperatures ranging from -30°C in the winter to $+30^{\circ}\text{C}$ in the summer. Rainfall is moderate in the area of the property with a snow free period only from June to October.

Property and Ownership (Figure 2)

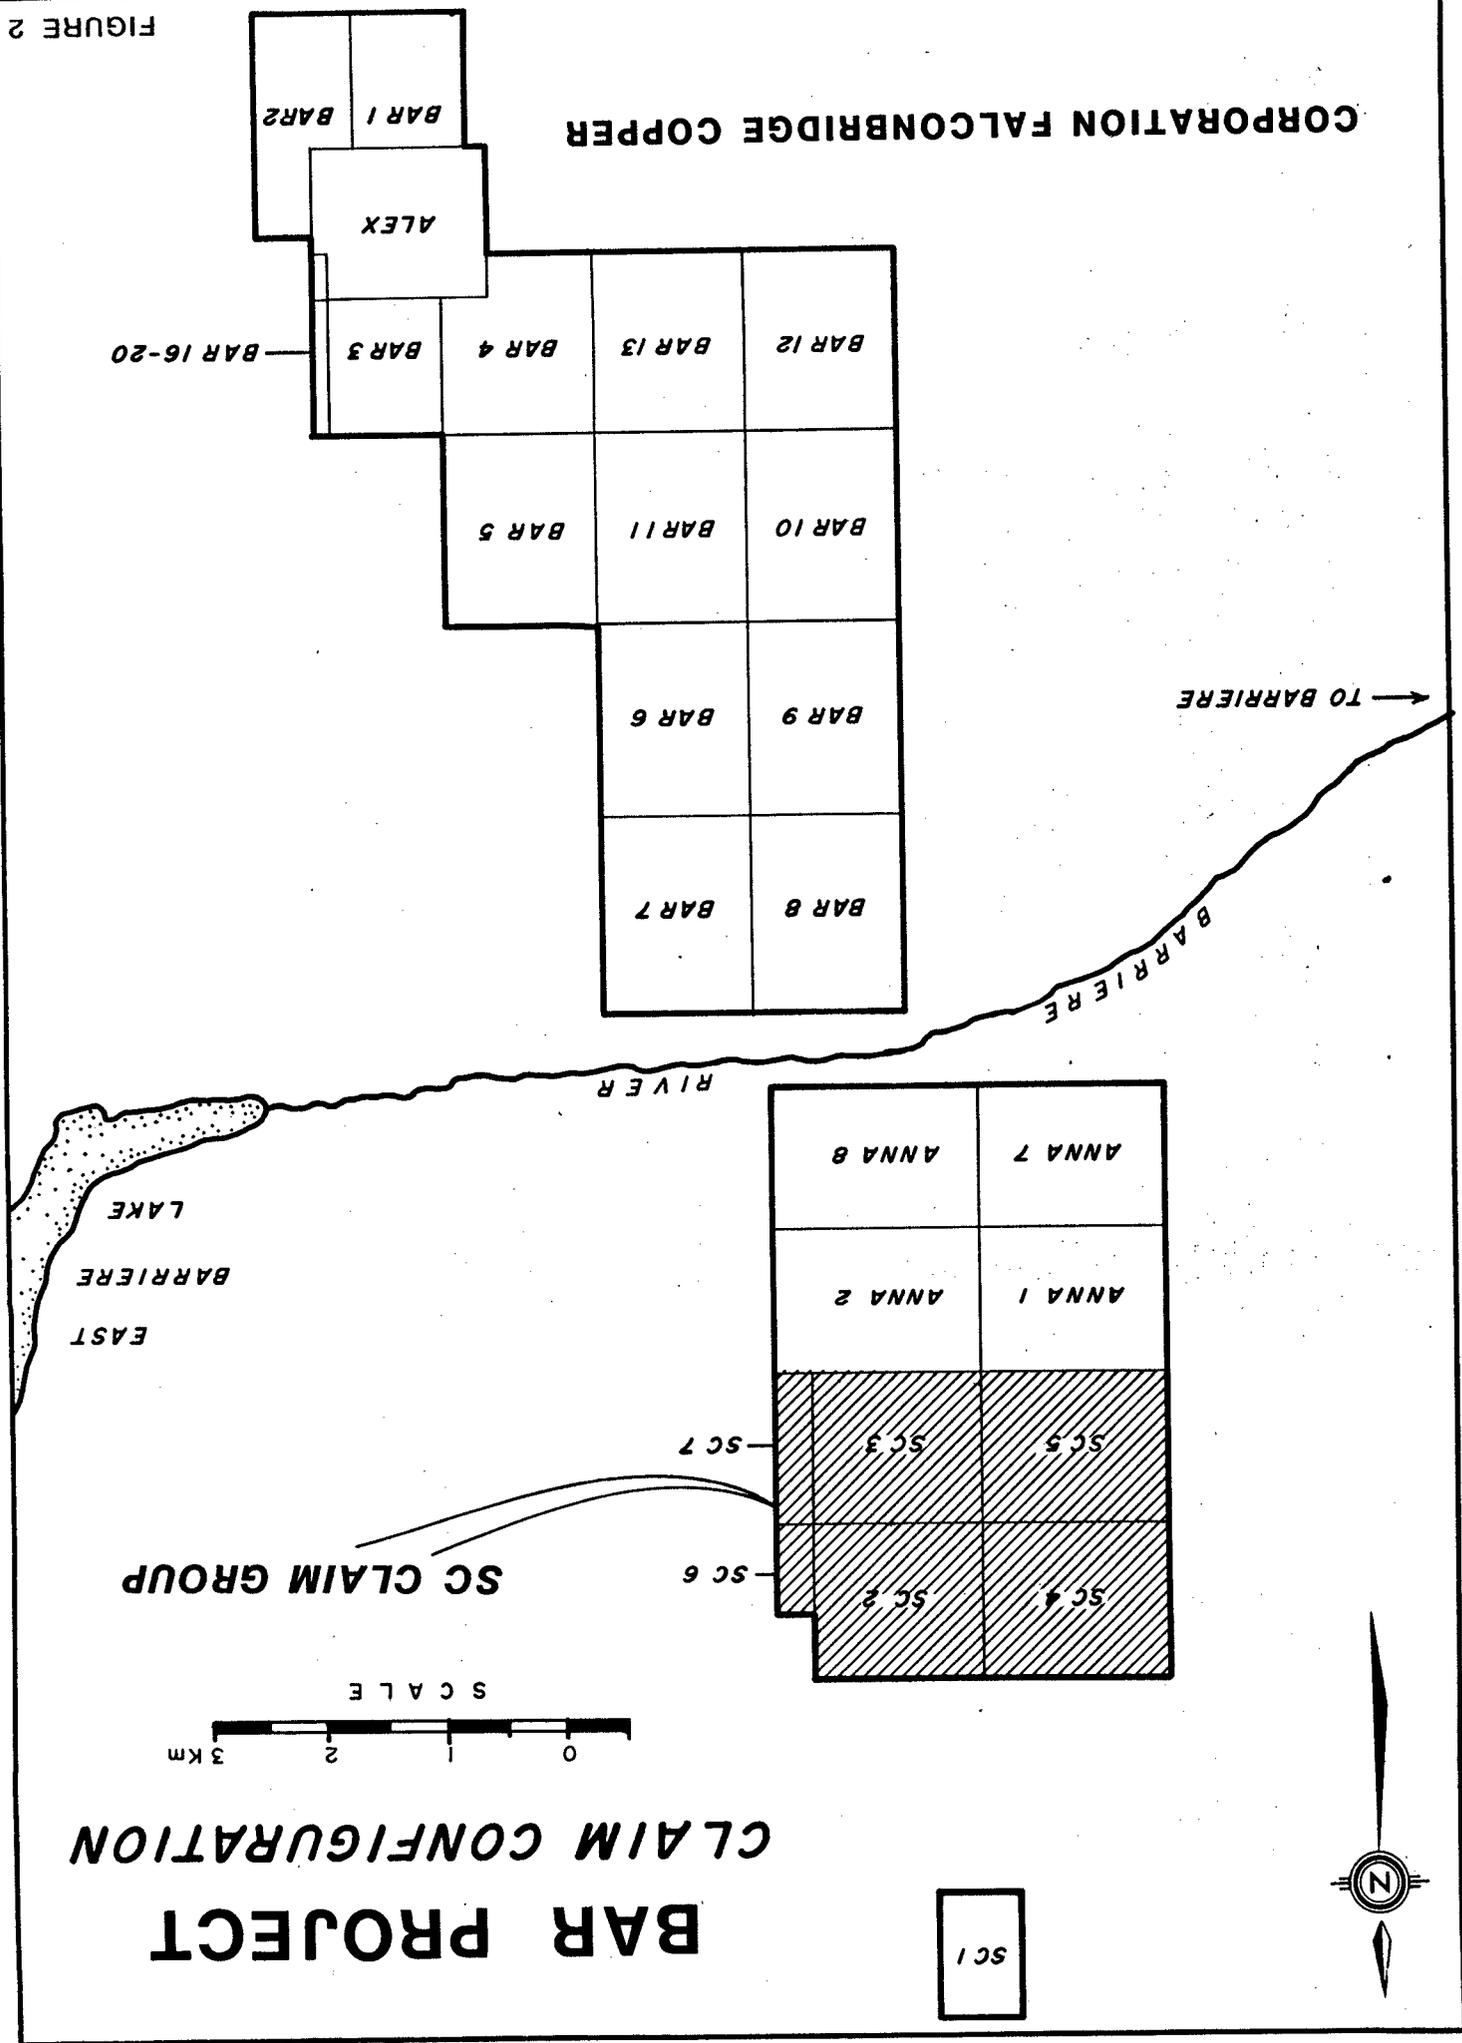

Figure 2 shows the configuration of the SC 2 Group. Table 1 summarizes the pertinent claim data. The claims are all 100% owned and operated by CFC.

SC6	5906	3	October
SC7	5907	6	October

History

The SC claims were acquired in the spring and fall of 1984 to cover favourable stratigraphy indicated by reconnaissance mapping and sampling. They contain stratigraphy correlative with the Chu Chua massive sulphide deposit 8kms to the north as well as felsic volcanic centres. The only evidence of previous work appears to be an airborne (Dighem) survey flown by Craigmont in 1978.

Summary of Work Done

From October 15th to October 29th 1986 four holes were drilled for a total of 518.91m, by J. T. Thomas Diamond Drilling Ltd. These were logged and split for analysis and the results are provided herein. *Analyses were done by Mim-En of North Vancouver; the core is stored at Barriere in the company warehouse.*

Geology

O.F. 53 (Scharizza) identifies the volcanics and sediments on the claim group as belonging to the (Devonian - Permian) Fennell Formation. The SC claim group has a series of felsic volcanic centres with accompanying rhyolite flows and breccias interbedded with marine sediments. These strike 140 to 160° in the area of the drilling and dip 50 to 80° to the east.

Purpose

Drilling was focussed around the felsic centres to test zones for potential massive sulphides. Mapping and lithogeochem sampling had suggested the presence of favourable horizons which, combined with buried conductors from a MaxMin II survey, provided drill hole targets.

Results

The drill holes generally confirmed the geology inferred from surface mapping. The MaxMin II conductors turned out to be graphitic argillites but the holes intersected complex rhyolite flows and tuffs with significant alteration and enhanced gold values. Bar 3, which was the only hole to actually intersect a felsic dome (due to abandonment of Bar 4 in a fault), returned significant gold and silver values. These included a 13.98m section averaging 242 ppb Au and a 2.52m section averaging 4.45 gm/T Au. This latter section included 30cms of massive pyrite assaying 18 g/T Au and 134 g/T Ag. The quartz-feldspar porphyry rhyolite dome is silicified and sericitized with an extensive quartz-pyrite stockwork.

Conclusions

The area is confirmed as being a favourable environment for massive sulphide deposits and further drilling is recommended. No syngenetic massive sulphides have yet been found but excellent alteration was encountered. Gold mineralization in the quartz-pyrite stockwork should be given exploration priority and further sampling and drilling should be undertaken to better understand it's significance.

Itemized Cost Statement

Direct Drilling Costs (J. T. Thomas Diamond Drilling)

Bar 1	\$14,580.10
Bar 2	\$12,712.45
Bar 3	\$14,284.00
Bar 4	\$9,015.20

Total Direct Charges \$50,591.75

Preparation of Drill Roads and Pads

(Blackhawk Diamond Drilling)

D-8 30 hrs @ \$105 per hr \$ 3,150.00

Supervision and Core Logging

G. Evans 15 days @ \$250 per day \$ 3,750.00
(October 15 - October 29, 1986)

Core Splitting and Sampling

M. Clayton 15 days @ \$150 per day \$ 2,250.00
(October 15 - October 29, 1986)

Accommodation and Food - 30 days @ \$20 per day \$ 600.00

Truck Rental 15 days @ \$50 per day \$ 750.00

Analytical Costs (Min-En Labs, N. Vancouver)

81 Lithochemical samples (15 elements) @ \$20/sample \$ 1,620.00

94 Geochemical samples (Cu,Zn,Pb,Ag,Au) @ \$12/sample \$ 1,128.00

Report Preparation

Drafting 2 days @ \$150 per day \$ 300.00

Interpret. & Report 2 days G. Evans @ \$250 per day \$ 500.00

Miscellaneous (materials, copying, typing etc.) \$ 150.00

TOTAL \$64,789.75

Certificate of Qualifications

I, Graeme W. Evans certify that:

1. I am an Exploration Geologist residing at #46 - 1810 Summit Drive,
Kamloops, B. C.
2. I have a BSc (Geol.) from the University of British Columbia (1983).
3. I have practiced my profession since 1983.
4. I personally carried out or supervised the work reported herein.

<u>From To</u>	<u>Rock Type</u>	<u>Texture and Structure</u>	<u>Angle to Core Axis</u>	<u>Alteration</u>	<u>Sulphides</u>	<u>Remarks</u>
0 to 3.08	CASING					
3.08 to 62.54	QFP RHYOLITE INTRUSIVE	Colour - lt. green to lt. grey Grain size - Med. Matrix extremely silic glassy rock with qtz + feldspar porphs from 1-3mm Rock is flooded with a stockwork of Qtz veins +/- sericite		Intense silicification +/- sericite veinlets. Propylitic alteration on fracture and rarely chl. In areas feldspar porphs are black (TiO2 alteration? or Mn) 49.2m-62.54m: Sericite alteration increasing	3-5% diss py with 1-2% py as veinlets (avg.=4-7%) 6.91-7.2m: zone with 60% py Occasional bleb of pyrrhotite	Qtz veins to 20cm
62.54 to 88.23	ARGILLITE	Colour - black to dark grey Grain size - fine Finely laminated argillite with siltstone interbeds Occasional slump breccia Rare 2cm thick rhyolite tuff band From 86m-88m occasional Rhyolite Tuff fragment	bedding 75 to 85	Graphite on fracture	1% diss py From 70-73m 2-4% py	Moderately conductive
88.23 to 94.50	QFP RHYOLITE TUFF	Colour - lt. green Grain size - fine Massive f.gr. tuff with occasional lapilli tuff zone with 1-2cm round frags		Weak sericite alteration with feldspars broken down	Tr py with rare py veinlets	Contact has loading of argillite by rhyolite tuff at 94.5m (tops up hole)
94.50 to 101.24	ARGILLITE	Colour - black to dark grey Grain size - fine to med. Finely laminated argillite with siltstone interbeds Occasional slump breccia	bedding 50 to 70		1-2% diss py cubes	Some argillite weakly conductive

<u>From To</u>	<u>Rock Type</u>	<u>Texture and Structure</u>	<u>Angle to Core Axis</u>	<u>Alteration</u>	<u>Sulphides</u>	<u>Remarks</u>
101.24 to 107.54	QFP RHYOLITE TUFF	Colour - lt. green Grain size - fine Massive f. gr. tuff with occasional round vague tuff fragment 1-2cm		Weak pervasive sericite alteration	Tr py	
107.54 to 111.40	QFP RHYOLITE CRYSTAL TUFF	Colour - lt. green Grain size - coarse Green sericitc alteration matrix with qtz phenos 1-4mm (euhedral) (80%) 1-2mm feldspar phenos (20%) mixed with siltstone beds	bedding 50 to 60	Mod. sericite alteration in matrix	Tr py	
111.40 to 115.96	ARGILLITE with SILTSTONE	Colour - black to dark gray Grain size - fine to coarse Beds of argillite and siltstone with occasional slump breccia zone	bedding 45 to 50		0.5%-1.0% diss py	Some argillite weakly conductive
115.96 to 121.00	RHYOLITE TUFF with ARGILLITE	Colour - lt. green Grain size - fine to coarse Fine gr. weak sericite altered QFP Rhyolite Tuff with occasional argillite unit 120.10-121.00m is a coarse crystal tuff with qtz phenos to 3mm		Weak to mod. sericitic alteration	Tr py	
121.00 to 127.25 EOH	ARGILLITE with SILTSTONE	Colour - lt. grey to black Grain size - fine Mixture of 50% argillite beds, 30% siltstone, 20% felsic tuffs Some argillite almost silicic enough to be chert	bedding 60	Mod. sericite alteration in rhyolite tuffs	Tr py	Argillite non conductive

- LEGEND**
- | ROCK TYPE | ROCK TYPE TEXTURAL CODES |
|--------------------------|--|
| 1 MAFIC VOLCANICS | 1. Massive flows
2. Pillowed flows, breccia |
| 2 INTERMEDIATE VOLCANICS | 3. Tuff, ash tuff
4. Lapilli tuff, lapilli and ash |
| 3 FELSIC VOLCANICS | 5. Agglomerate (block size frags > 64mm)
6. Tuff breccia
7. Debris flow (1, 2, or 3 depending on predominant fragment types) |
| 4 MAFIC INTRUSION | 1. Diorite
2. Gabbro
3. Diabase |
| 5 FELSIC INTRUSION | 1. QFP |
| 6 SEDIMENT | 1. Chert, ribbon chert, chert breccia
2. Chert with argillite
3. Quartzite argillite for wacke
4. Quartz pebble conglomerate
5. Argillite/phyllite
6. Limestone
7. Breccia (for quartz wackes) or greenwacke (contingent on chert content)
8. Limestone cobble breccia
9. Coarse wackes/grit; 2 sandstones
10. Multifaceted pebble conglomerates (with micaceous clasts, argillite clasts etc.) |

- ABBREVIATIONS**
- QFP-quartz feldspar porphyry, bx-breccia, chl-chlorite, epi-epidote, arg-argillite, carb-carbonate, py-pyrite, frags-fragments, alt-altered, tr-trace, ill-floot, sil-siliceous, stwk-stockwork, Grn-green, fgr/frags/frg-fine, med, med, coarse grained
