SUMMARY

Mandusa Resources Ltd. optioned 111 claim units and claims in the Spanish Mountain - Spanish Creek area of the Cariboo in June 1986, and carried out a field exploration program on the property from July to mid October.

Work carried out by the owner on contract to Mandusa consisted of prospecting, trenching, sampling, chain and compass surveying, and drill site preparation. Mandusa carried out surveying, examination, sampling, geological mapping and supervision of the program, and contracted out picket line cutting, Induced Polarization survey, and percussion drilling.

CONCLUSIONS AND RECOMMENDATIONS

1. Geological mapping identified two gold mineralized geological environments. One environment, aided in identification by the I.P. survey, is dominated by a broad graphitic shear zone extending westerly from Spanish Lake. The other environment appears to be a stratigraphic succession of sediments and volcanic derived sediments into which gold bearing quartz veins have intruded fractures and/or local shears, and generally have produced alteration haloes.
2. Drilling of the large shear zone in the Don claims area indicates ubiquitous anomalous gold values within at least a 100 x 300 m area of the shear. Five holes drilled in this area, with a total footage of 1020 feet (310.9 m) sampled, indicate: 865 feet (263.6 m) with an average grade of 0.008oz Au/Ton; or, 230 feet (70.1 m) with an average grade of 0.015 oz Au/Ton. The best assay returns indicate a grade of 0.033 oz Au and 0.7 oz Ag/Ton in one five-foot length within a 75-foot intersection that averages 0.015 oz Au and 0.109 oz Ag/Ton.
3. Percussion drilling on the Peso claim identified one area, the "Green" Pit area, to host encouraging gold intersections. An apparent horizontal structure, related to shearing and/or fracturing within nodular phyllite, extends for at least 40 m at a depth of about 10 m below surface. Of the three holes drilled in this area: one hole intersected 10 feet (3.05 m) with an average grade of 0.206 oz Au and 0.122 oz Ag/Ton; another hole intersected 10 feet (3.05 m) with an average grade of 0.024 oz Au and 0.061 oz Ag/Ton, plus 5 feet (1.52 m) with a grade of 0.079 oz Au and

0.058 oz Ag/Ton; and the third hole intersected 5 feet (1.52 m) of 0.071 oz Au and 0.015 oz Ag/Ton, 10 feet (3.05 m) of 0.532 oz Au and 0.267 oz Ag/Ton, 10 feet of 0.049 oz Au and 0.031 oz Ag/Ton, and 20 feet (6.1 m) of 0.032 oz Au and 0.025 oz Ag/Ton.

4. The percussion drilling method used did not reflect gold values previously obtained in surface sampling, nor did it support the expectation related to the presence of visible gold and mineralization in outcrop. The percussion drill technique and sample collection method are highly suspect in being able to provide representative samples, at least in the Don claim environment.

It is recommended that the Don claim area be investigated further, mainly to establish a credible gold content through large diameter drilling and bulk sampling, with great care given to collection method and sampling technique. Thorough stripping, trenching, sampling, and evaluation should be done prior to drilling, within a 150 m x 500 m area encompassing drill holes PH86-1, PH86-2 and PH86-5.

It is recommended that stripping and trenching be carried out in the "Green" Pit area to aid better geological evaluation. Further drilling should be also carried out, initially with vertical holes using more refined drilling and sampling techniques, to define the extent of gold mineralization. Stripping and trenching should also be directed to the north-northeasterly and opposite extensions of alteration and potential gold mineralization of the "Blonde" and "Hi-Grade" showings prior to further drilling on Peso claim.

Consideration should also be given to intensifying prospecting and examination of many parts of the property, still relatively untouched; with view to test for the presence of a Frasergold type deposit. and to test extensions on Peso claim of CPW claim mineralization. Eureka Resources Inc., recently employed a large-diameter reverse circulation drill, and large diameter (4-inch core) diamond drill to help overcome a sampling problem on their Frasergold property, apparently located in a similar geological environment to the Spanish Mountain property. Possible reserves at Frasergold are reported in "Canadian Penny Mines Analyst" (January 15, 1987), to be 3.5 million tons grading 0.2 oz/ton gold. A 1985 Mt. Calvary Exploration Ltd. exploration report contains an estimate of a probable reserve of nearly 400,000 tons grading 0.1 oz/ton gold on CPW claim, with zone open on strike to the southwest.

INTRODUCTION

Under an option agreement with Diana V. Mickle and Robert E. Mickle of Likely, B.C., Mandusa Resources Ltd. carried out in 1986 an exploration program to assess gold bearing occurrences in the Spanish Mountain area near Likely, B.C.

Property:

The thirteen optioned mineral claims and one fractional claim are all within Cariboo Mining Division, and are listed as follow:

<u>Claim</u>	<u>Record No.</u>	<u>No. of Units and Claims</u>	<u>Registered Owner</u>	<u>Expiry Date</u>
Peso	487	9 units	Diana V. Mickle	Sept. 21/88
Don 1	1383	2-post claim	Diana V. Mickle	Dec. 24/87
Don 2	1384	2-post claim	Diana V. Mickle	Dec. 24/87
Don 3	1385	2-post claim	Diana V. Mickle	Dec. 24/87
Don 4	1386	2-post claim	Diana V. Mickle	Dec. 24/87
Jul 2	1853	9 units	Diana V. Mickle	Aug. 8/88
Mar 1	4716	15 units	Diana V. Mickle	Mar. 21/87
April Fr.	4771		Diana V. Mickle	Apr. 22/87
My 1	4861	2 units	Diana V. Mickle	May 30/87
De 2	5625	10 units	Diana V. Mickle	Dec. 14/87
De 3	5626	16 units	Diana V. Mickle	Dec. 14/87
Mey 1	7656	20 units	Diana V. Mickle	May 8/87
Mey 2	7657	20 units	Diana V. Mickle	May 8/87

Total: Four 2-post claims, 1 fractional claim, and 101 units.

Two fractional mineral claims staked in 1986 to become part of the option agreement are as follows:

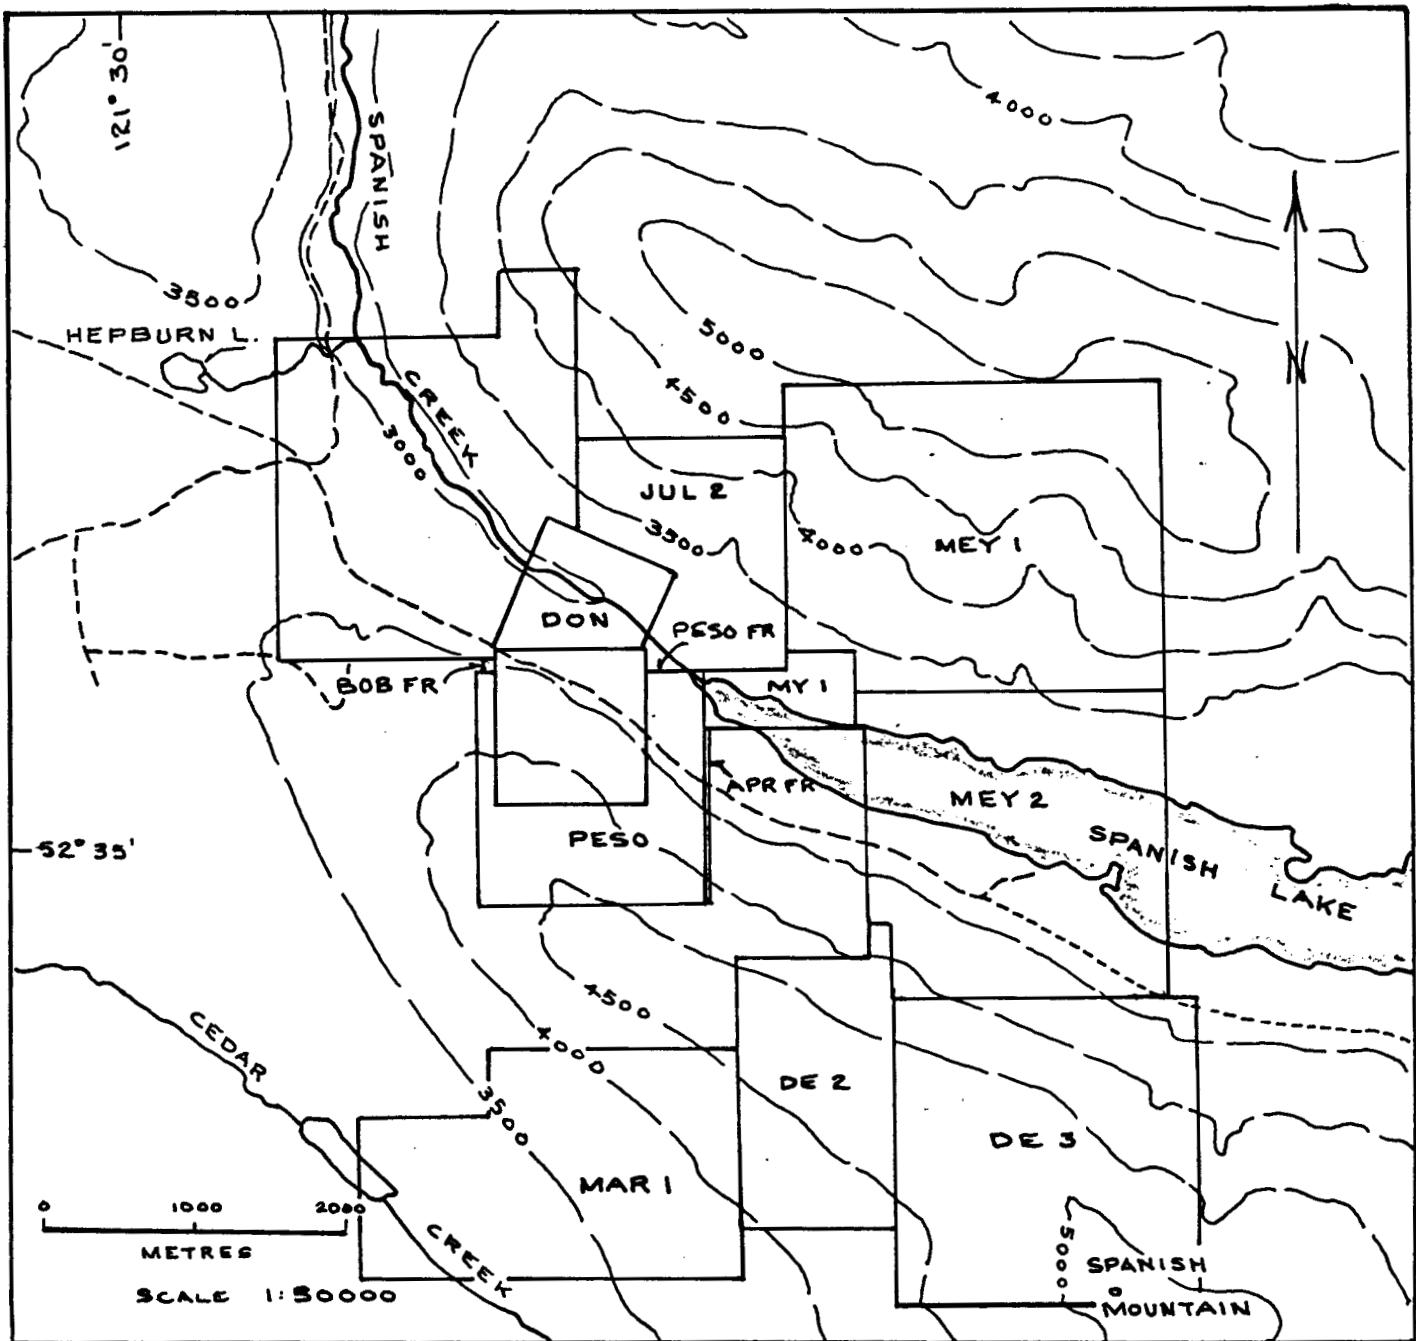

<u>Claim</u>	<u>Record No.</u>	<u>Registered Owner</u>	<u>Expiry Date</u>
Bob Fr.	8061	Mandusa Resources	Oct. 7/87
Peso Fr.	8062	Mandusa Resources	Oct. 7/87

Note: Lot 12083, near the outlet of Spanish Lake, lies within Peso claim.

Location and Access:

NTS 93 A/11W

The Spanish Mountain property is centred on the outlet of Spanish Lake, at 52° 35.6' North and 121° 26.6' West, extending north-south from the crest of Black Bear Mountain to the crest of Spanish Mountain, and from western Spanish Lake to the turning northward of Spanish Creek. The topography is moderate, with elevations ranging from 920 m at Spanish Lake to about 1500 m on both mountains. Natural

To accompany report by R.J.Nicholson, B.A.Sc., P.Eng.

outcroppings of rock are rare; overburden is relatively thin but effective, and forest cover is dense except where logged. The recent logging has provided better local access.

Access to the property is from the village of Likely, situated at the outlet of Quesnel Lake. Paving of the highway northerly from 150 Mile House to Likely was finally completed in 1986. The best access from Likely to the property is via the all-weather Spanish Lake haul road that passes Hepburn Lake near the air strip, about 6.5 km from Likely. Access within the property boundaries is provided by logging and rough bush roads.

The property engulfs CPW mineral claim (the older Mariner II Property), owned by C.P. Wallster and subsequently optioned to Pundata. A 1985 exploration report on the "CPW Gold Prospect" by Mt. Calvary Resources Ltd. states that "To date, drilling and trenching results indicate the Madre Zone to have a probable reserve of nearly 400,000 tons grading 0.1 oz/Ton gold, with the zone open on strike to the southwest and to depth. The ultimate potential reserve of the Madre Zone to a depth of 70 m and over a strike length of 350 m is believed to be in excess of 1 million tons grading 0.1 oz/Ton gold"; and that "Gold mineralization on strike with the Madre Zone has been observed on the Peso ground, a distance of 50 metres from the claim boundary, with the favourable shale and shaly siltstone units exposed for over 250 m south of the claim boundary."

History:

Interest in gold in the area dates from the earliest mining activity in British Columbia. Prospecting and exploration activity for lode deposits on the north slope of Spanish Mountain dates to at least 1933. Work on the subject property has only more recently been undertaken as follows:

1979 - Aquarius Resources. Although Peso claim was part of the property, a geochemical survey was carried out on Peso B mineral claim only.

1981 - Aquarius Resources. A very limited geochemical survey was carried out on Peso claim. An airborne electromagnetic and magnetic survey was flown to cover Peso, Peso B and Peso E mineral claims.

- 1981/82 - Norsemont Mining Corp. and R.E. Mickle carried out prospecting, stripping by bulldozer, and excavating backhoe trenches on the Don claim.
- 1983 - Lacana Mining Corporation on behalf of Canadian Minerals joint Venture, carried out line cutting; soil sampling primarily on Don, Jul 2, March 1 and lower Peso claims; rock sampling on Don claim showings; VLF survey on and adjacent to Don claims; geological mapping on the gridded area; road construction for backhoe access; and excavation of trenches and test pits by backhoe and by hand.
- 1984/85 - Hycroft Resources and Development Ltd. after initiating a contracted property examination report, carried out a soil sampling program and trenching on Peso claim.
- 1985 - Mt. Calvary Resources Ltd. acquired the property from Hycroft and carried out a diamond drilling program on Peso claim. Because of a dispute between Hycroft and Mt. Calvary, Hycroft logged the core in early 1986 in order to apply assessment credit.
- The 1986 diamond drilling report written for Hycroft Resources and Development Ltd. recorded an assay of 0.158 oz/Ton gold over 3.0 m near the bottom of Hole 85-MD-13.
- 1986 - Mandusa Resources Ltd. Following two examinations made by Dr. P.H. Sevensma, the property was optioned by Mandusa on June 21, and an exploration program was initiated in July. Ten random samples averaging 0.65 kg weight, taken in the examinations from several trenches located on three well-separated claims, returned assays as follows: 0.316, 0.810, 0.419, 0.670, 0.456, 2.580, 0.001, 0.003, and 0.840 oz Au/Ton.

1986 WORK PROGRAM

Work was carried out by Robert E. Mickle and by Mandusa Resources Ltd. Work by Mickle was done mostly under contract to Mandusa, and consisted of trenching, pitting, bridge construction, road and drill site access, trench sampling, chain and clinometer surveying, prospecting, and guidance. Work carried out by Mandusa consisted of surveying, geological mapping, trench sampling, line cutting, geophysical surveying, and drilling with related sampling.

Surveying:

A transit stadia survey was carried out by the writer, to resolve a problem of spatial relationships of claim boundaries, older trenches, various meanderings of access roads, and geological observation. Previous picketed lines are essentially non-existent, and significant elevation differences in a relatively densely forested area created difficulty in areal relationship. The survey ties in to the already surveyed western corners of CPW claim, and provided a network to relate some trenches, roads, legal corner posts, topographic features, a new picketed grid, drill holes and subsidiary chain-clinometer surveys. All data were reduced to coordinates, and computer programmed to provide control for maps on chosen scales.

Line Cutting:

An old line was re-established as an 800 m base line with bearing of 285° , about 100 m south of Spanish Creek on Don claims. Picket lines at 100 m interval were cut from Spanish Creek to Spanish Creek road.

A second grid was established on Peso claim, with baseline along the southern boundary of CPW mineral claim, and six picket lines cut north-south at 100 m interval from CPW claim to the southern Peso boundary; plus two north-south lines on the eastern portion of the claim.

Under contract to Bill Chase, all lines were cut with power saw and picketed at 25 meter interval. A total of 5,500 meters were cut on Don claims, and 6,500 meters were cut on Peso claim.

Geophysics:

An Induced Polarization survey was carried out over portions of Don claims and Peso claim, under contract to Alan Scott. A total of 7.675 line-kilometers were surveyed: 4.075 km on Don claims, and 3.6 km on Peso claim.

Geological Mapping:

Geological mapping was carried out by the writer on a portion of the Don claim area, and on most of Peso claim area where bedrock is exposed. A section on "Geology" follows.

Drilling:

Fifteen percussion holes were drilled: six on Don 2 and Don 3 claims, and nine on Peso claim. Two holes on Peso claim were drilled vertically; all the rest were

inclined at 45°. Samples were collected mostly in five-foot increments; dry if possible, and wet below the water table. Drilling totalled 2733 feet; 1170 feet on Don claims, and 1563 feet on Peso claim.

The drilling was contracted to Tonto Drilling B.C. Ltd. A self-propelled Nodwell Carrier-mounted percussion drill was provided, that drilled 1½" diameter holes.

A discussion of results is included under "Geology", following.

Sampling:

Rock samples were taken for comparison of prior sampling evidence, but primarily to test values in new trenches. Soil samples were also collected to corroborate and expand prior evidence.

321 rock chip samples from trenches, and 198 soil samples from traversed lines in areas of interest were collected and analyzed. In addition, five drill core samples from 1985 drilling on Peso claim, and 502 percussion drill samples were analyzed.

Initially in 1986, 264 rock chip samples analyzed by Acme Analytical Laboratories Ltd. in Vancouver, were tested by 16-element ICP and later 30-element ICP method including gold and silver. Checks on 27 pulps from these samples indicating significant metal content were done by fire assay. An initial 131 soil samples were also analyzed by Acme using the ICP technique for gold and silver. The five drill core samples were fire assayed.

Min-En Laboratories Ltd. in Vancouver, from mid August analyzed a further 67 soil samples by Atomic-Absorption method, of which 21 samples were tested by fire assay. All 502 percussion drill samples were analyzed by Min-En Atomic Absorption and fire assay.

Percussion drill samples were split 50/50, and collected in polyethylene "Glad" bags lining a metal dust bin. Dry samples were split with a Jones riffle splitter; wet samples were split equally by a Tee, with flocculant added to the sample before decanting. All "Glad" bag samples were further enclosed in standard polyethelene sample bags. Half of each sample was submitted to Min-En Laboratories; and the other half was submitted to the property owner, under the terms of the option agreement, for storage in Likely.

GEOLOGY

Regional Geology:

The property lies within an area underlain by Upper Triassic and/or Lower Jurassic rocks of the Quesnel Trough, close to the southwestern boundary of the Omineca Crystalline Belt, about 75 km northeast of Pinchi Fault. G.S.C. Open File 920 indicates a poorly exposed sequence of clastics and volcanics in the vicinity of the property, overlying and in part thrusted over the undifferentiated Paleozoic (?) Snowshoe Group and the Permian Slide Mountain Group. The property appears to be situated in a similar geological environment as the Frasergold property about 70 km to the southeast, also within the eastern Quesnel Trough. Drill indicated, semi-conformable stratabound gold reserves at Frasergold are recently reported to be 3.5 million tons grading 0.2 oz/ton gold. ("Canadian Penny Mines Analyst", January 15, 1987)

As defined, the Upper Triassic unit at Spanish Lake is undifferentiated and consists of black shale slate and argillite, micritic limestone and limy sandstone; and is probably overlain by Upper Triassic/Lower Jurassic black shale and argillite, andesite derived greywacke, andesite and basalt.

Local Geology:

Don Claims

The area is characterized by a graphitic shear zone that occupies the low land of Spanish Creek. The shear has the same bearing as Spanish Lake, about N65° W, and is at least 500 m wide. The resistivity contour plan of the IP survey appears to define the southern boundary of the zone, as well as to indicate "horses" within the shear.

Evidence of unsheared rock in the Spanish Creek valley exists in two locations: on the "upper access road" to Don claims, about 400 m from its intersection with Spanish Lake road; and at the "lower access road" turnoff near where drainage from Hepburn Lakes crosses the road to the garbage dump. The sediments on the upper access road dip gently to the southwest; the substantial outcrop on the lower access road consists of thinly laminated fissile shales, dipping 25° to the northwest.

Schists within the shear zone have essentially the same strike as the shear, with dips 60° SW to vertical. Quartz veins in the shear strike northerly to northeasterly across the shear, with westerly dips from 45° to vertical.

One occurrence was observed of thrust faulting within the shear, having an attitude of N 10° E/25°W. One occurrence was observed of drag folding within the shear. Quartz veining accompanies both occurrences.

Peso Claim

The claim covers a relatively undisturbed succession of recessive dark clastics and minor volcanics, interlayered with more-resistant nodular phyllite. A northwesterly trending shear zone transects the claim, with the undisturbed succession occupying most of the claim to the south, and a smaller disturbed succession more closely allied with rock types on CPW claim to the north.

Notes on interpretation of the relatively few exposures, all created by man, are as follows:

1. Thinly laminated bedding is present in at least two argillitic exposures, both exhibiting a north-northeasterly bearing and dip of 45° to 50° East.
2. Although not in place but definitely near source, a specimen of cross-bedded clastics implies fluviatile origin.
3. Nodular phyllite predominates, and is of unknown origin. Abundant clasts forming nodules to 6mm in size are considered to be ankerite. If the phyllite can be presumed to have an attitude conformable with the bedded argillite, then the phyllite correlates approximately with a sheared outcrop of phyllite at the outlet of Spanish Lake.
4. Quartz veins appear to be associated with nodular phyllite on Peso claim, because of a presumed relatively brittle nature of the phyllite.

The quartz veins within the phyllite generally strike north-northeast to northeast, and dip moderately to steeply to the northwest. Quartz veins in the central part of the claim, specifically in the "Green Pit" area and toward the shear zone, exhibit various strikes and dips from vertical to flat lying.

5. A few light-coloured layers appear to be conformable within the black shales and schists of the northeastern portion of the claim. The lighter layers are considered to be volcanic in origin, and are designated as an "ash fall tuff". The shear zone separates phyllite from shales. The Induced Polarization survey indicates the schists and shales to have much lower resistivity than the phyllite.

The black shale, - ash fall tuff sequence appears more closely related to CPW claim environment. The shales and tuff layers on Peso claim strike northeasterly and dip 25° E.

Mineralization:

Don Claims

It is proposed that by preservation of the valley floor through stagnant glaciation, a deeply weathered bedrock remains. It appears that the weathered portion of the graphitic schist at one time contained a significant proportion of disseminated auriferous pyrite, which now contains minute gold remnant particles in voids.

Quartz veining in the schist is relatively common and occurs mainly as steeply dipping veinlets at right angles to the axial plane of the shear. Veins or veinlets are mostly less than 6" wide, have lengths at least up to 50 feet, and occur to some extent in swarms. Quartz veins also occupy other low pressure areas, related to singly known instances of drag folding and thrust faulting. Some quartz veins parallel the schistosity, and might be related to pressure shadows of "horses" within the shear.

Quartz veins perpendicular to the shear occasionally carry varying minor amounts of pyrite, chalcopyrite, galena and bournonite (?), in addition to gold.

Narrow zones of "aerobar" formations also lie perpendicular to the shear plane. "Aerobar" is a local appellation for a porous shaly rock that at one time possibly contained a significant proportion of disseminated pyrite.

Gold appear to be ubiquitous within the shear; with better values occurring within sulphide or sulpho-salt mineralized quartz veins, narrow quartz veins carrying pyrite and within "Aerobar" structures.

Representative sampling has been a problem. Fine gold can be identified by panning of broken material in many trenched areas. Gold can be identified in some quartz voids previously occupied by pyrite, and occasionally can be seen as very thin flakes still surrounding - perhaps as exsolution products - a long-gone pyrite crystal. Attractive assay returns from a freshly exposed trench face are reported always to be better than later check samples. Most schist exposures, because of an extremely friable nature, do not lend to accurate sampling. And, the percussion drilling method used in 1986 is suspected to have either floated off a significant amount of fine gold not collected in the sampling process, or to have enlarged the drill hole sufficiently to omit lifting gold with the cuttings.

Peso Claim

Bed rock in the area is relatively fresh. Glacial scour and thin till on bedrock provide evidence of recent glaciation.

The quartz veins are commonly enveloped in buff or blonde alteration haloes, with the extent of alteration seemingly disproportionately large relative to the quartz vein. The alteration appears to be a product of silicification, having destroyed most pre-existing texture, and having a very similar appearance to ash fall tuff. Commonly, large pyrite porphyroblasts to 10 mm are associated with alteration envelopes within the shear zone.

As well as visible gold, trenching in the "Green Pit" area divulged the presence of mariposite alteration, pyrite, chalcopyrite and galena. The "Blonde Trench" area exhibited gold, galena and chalcopyrite in vein material at surface.

Drilling Results:

The original plan for drilling included testing with either diamond drill, or with a reverse circulation drill. For several reasons, the testing had to be done with a percussion drill, which is considered an inferior tool.

Drill holes were planned to have a maximum length of 200 feet. Samples were collected in 5-foot intervals throughout the length of each hole, and a one-half split of all cuttings were provided as duplicate samples to the property owner. The primary samples all were analyzed by Min-En Laboratories in North Vancouver.

Because of the drilling method applied and nature of the sample, examination of cuttings to determine rock types was virtually impossible.

Don Claims

Six inclined holes were drilled, totalling 356.6 m (1170 ft). The drill sites were located to test better-known mineralization in areas of reasonable access. Holes were spotted to intersect the cross-cutting mineralized quartz veins and other mineralization of the shear zone.

The results of the first drill hole, PH86-1, are considered not reliable due to significant difficulties experienced in both drilling and sampling.

The other five drill holes, PH86-1 to PH86-6, were drilled in an area of about 100 x 300 m oriented lengthwise within the shear, somewhat separate from PH86-1 area. The best assay from the five holes indicates a grade of 0.033 oz Au/Ton in one five-foot length. A total of 865 feet (263.6 m) of samples from 1020 feet (310.9 m) drilled in five holes average 0.008 oz Au/Ton; a total of 230 feet (70.1 m) of samples from the same holes average 0.0147 oz Au/Ton.

One of the five holes, PH86-3, drilled to test quartz veining and associated sulphides of the "Bournonite" zone, cut one 5-foot length of 0.033 oz Au/Ton and 0.7 Ag/Ton within a 75-foot intersection that averages 0.015 oz Au/Ton and 0.109 oz Ag/Ton.

Peso Claim

Nine holes were drilled, seven inclined and two vertical, totalling 476.4 m (1563 ft). Four areas were drilled: three areas in phyllite environment, and one area in the shear zone.

Three areas within phyllite were drilled as follows:

1. "Hi-Grade" Pit

Two holes, PH86-7 inclined and PH86-8 vertical, were drilled to test down the dip of a quartz vein that had been exposed by trenching. The vein strikes northeasterly and dips moderately to the northwest. Considerable bleached alteration is present at surface and can be traced for 100 m. Surface sampling in the trench indicated grades of up to 2.5 oz Au/Ton. The best grade indicated in drilling is 0.004 oz Au/Ton in 5 feet (1.52 m).

2. "Green" Pit Area

Initial trenching exposed an area of gently dipping quartz veins within a mariposite-rich alteration zone. Further trenching exposed a horizontal vein mineralized with visible gold, minor pyrite and some chalcopyrite. Subsequent trenching exposed steeply to gently dipping veins, shearing, and bedded argillite; and as reported by the owner, also removed the high-grade gold vein.

Three holes were drilled; one vertical and two inclined. An apparently east-west linear mineralized zone about 40 m long was intersected at about 10 m depth, with significant grades in all three holes. Grades and intersections are tabulated as follows:

<u>Hole No.</u>	<u>Intersected Length ft(m)</u>	<u>Vertical Depth (m)</u>	<u>Grade</u>	
			<u>oz Au/T</u>	<u>oz Ag/T</u>
PH86-9(-90°)	10 (3.05)	7.6 to 10.7	0.206	0.122
PH86-10(-48°)	10 (3.05)	9.1 to 11.3	0.024	0.061
	5 (1.52)	11.3 to 12.4	0.079	0.058
PH86-11(-45°)	5 (1.52)	4.3 to 5.4	0.071	0.015
	10 (3.05)	7.5 to 9.6	0.532	0.267
	10 (3.05)	9.6 to 11.8	0.049	0.031
	20 (6.10)	12.9 to 17.2	0.032	0.025

3. "Blonde" Trench Area

One inclined hole, PH86-14, was drilled to test under the gold-galena-chalcopyrite mineralized quartz veining exposed in the trench. Considerable bleached alteration appears to surround the vein. The vein strikes north-northeasterly and dips steeply.

No grade of interest was intersected under the surface trace of the vein. However, a 10 foot (3.05 m) length indicating 0.021 oz/Ton was intersected at the drill collar, in an area of overburden.

The area within the shear zone was tested by two drill holes as follows:

1. Cabin zone

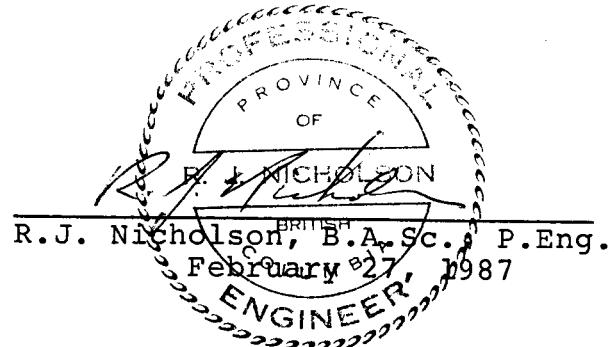

One inclined drill hole, PH86-12 to test reported interesting assay values in graphitic schist, and also to test for an extension at depth of an old working beside the cabin, intersected five feet of 0.120 oz Au and 0.137 oz Ag/Ton. The intersection essentially confirmed the extension of the old working, and indicates that mineralization within the shear zone lies at an acute angle to the axis of the shear.

2. Lower Landing

Two inclined drill holes, PH86-13 and PH86-13A together provided a 200-foot test of quartz mineralized shear zone. No gold values of interest were intersected.

ESTIMATED COST OF RECOMMENDED EXPLORATION PROGRAM

Stripping, Drill Access, and Reclamation Bulldozer - 15 days @ \$700/day	\$10,000
Trenching and Bulk Sampling Backhoe - 10 days @ \$400/day	4,000

APPENDIX B
STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATION

I am a consulting geological engineer residing at 1021 Beaumont Drive, North Vancouver, British Columbia, and do hereby certify:

1. I am a graduate of The University of British Columbia (1953) in Geological Engineering and hold a Bachelor of Applied Science degree.
2. I am a registered member, in good standing, of The Association of Professional Engineers of the Province of British Columbia, and also of the Association of Professional Engineers of the Province of Ontario.
3. Since graduation, I have worked continuously as a mine geologist, exploration geologist or geological engineer, in all parts of Canada.
4. I supervised the field program on the Spanish Mountain property, and carried out geological mapping, surveying, and sampling.
5. I have no direct or indirect interest in the property herein described, or in any securities of Mandusa Resources Ltd., nor do I expect to receive any.
6. This report may be utilized by Mandusa Resources Ltd. for inclusion in a Prospectus or Statement of Material Facts.

1. INTRODUCTION

Induced polarization and resistivity surveys were conducted over portions of the Spanish Mountain Property, Likely Area, B.C. on behalf of Mandusa Resources Limited, in the period September 5 to 11, 1986. The work was performed by Alan Scott, Geophysicist.

The pole dipole electrode array at an "a" spacing of 25 meters, and "n" separations of 1, 2, 3, 4, and 5, was used on the induced polarization survey. The current electrode was to the north of the receiving electrodes on all survey lines.

2. SURVEY LOCATION

The Spanish Mountain Property is located some 10 kilometers east of Likely, B.C. Access is via the Spanish Lake road from Likely.

3. SURVEY GRID AND SURVEY COVERAGE

The survey was conducted over two separate claim blocks, the Don Claims and the Peso Claims. 4.075 line kilometers on 8 lines were surveyed on the Don Claims and 3.6 line kilometers were surveyed on 6 lines on the Peso Claims. Details of survey coverage are given in the previously submitted production reports.

4. PERSONNEL

Alan Scott operated the IPR-11 receiver. Dave Carr, Ken Moir, Steve Davies and Spencer Robinson made up the survey crew.

Bob Nicholson^{was} the project geologist on site on behalf of Mandusa.

5. INSTRUMENTATION

A Scintrex IPR-11 time domain microprocessor based induced polarization receiver and a Scintrex IPC-7 2.5 kw transmitter were used on the survey. The IPR-11 operates on an alternating square wave transmitted current pulse train, and samples the decay curve at ten semilogarithmically spaced times after cessation of each pulse. A 2 second on/2 second off pulse was used on the survey. The data is continually averaged until the operator is satisfied convergence has occurred, and is filed into solid state memory. The eighth slice (from 690 to 1050 milliseconds after shutdown: midpoint at 870 milliseconds) is the value that has been plotted on the plans and pseudosections.

The survey data was archived, processed, and plotted using a Corona PPC 400 microcomputer running the Scintrex Soft II software. All decay curves were submitted to spectral analysis by a curve matching procedure.

6. RECOMMENDATIONS

A preliminary examination of the IPR11 survey results on the Spanish Mountain Project indicates that the areas of extremely low resistivity (often less than 1 ohm meter), coincident with moderate to strong chargeability and strong SP gradients, located over most of the Don survey area and in the northeast corner of the Peso survey area, are mapping the extent of graphitic shear zones.

Within these very low resistivity areas it was often not possible to obtain accurate chargeability values at the further separations. In those cases where resistivity measurements could be made, but where the chargeability values were too erratic, the chargeability values have been edited to read ".0" on the data listings and pseudosections.

A detailed interpretation of these results, and correlation to the geological and geochemical data bases, is recommended.

Respectfully Submitted,

Alan Scott,
Geophysicist

ASSAY CERTIFICATE

1.00 GRAM SAMPLE IS DIGESTED WITH 50ML OF 3-1-2 OF HCL-HNO3-H₂O AT 95 DEG. C FOR ONE HOUR.
AND IS DILUTED TO 100ML WITH WATER. DETECTION FOR BASE METAL IS .01%.

- SAMPLE TYPE: ROCK CHIPS AUR 10 GRAM REGULAR ASSAY

DATE RECEIVED: JULY 14 1986 DATE REPORT MAILED: July 19/86 ASSAYER: *D. Toye* DEAN TOYE. CERTIFIED B.C. ASSAYER.

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR Mn,Fe,Ca,P,CR,Mg,Ba,Tl,Al,Na,K,W,Si,Zr,CE,Sn,Y,Nb AND Ta. Au DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: SOIL -80 MESH Au ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: JULY 16 1986 DATE REPORT MAILED: *July 23/86* ASSAYER: *D. Toye* DEAN TOYE. CERTIFIED B.C. ASSAYER.

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN.FE.CA.P.CR.MG.BA.TI.B.AL.NA.K.W.SI.ZR.CE.SN.Y.NB AND TA. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOILS -80 MESH AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

ASSAYER: *D. Deley* DEAN TOYE. CERTIFIED B.C. ASSAYER.

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH JML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
 THIS LEACH IS PARTIAL FOR MN.FE.CA.P.CR.MG.BA.TI.B.AL.MA.K.W.SI.ZR.CE.SN.Y.NB AND TA. AU DETECTION LIMIT BY ICP IS 3 PPM.
 - SAMPLE TYPE: ROCK CHIPS AU ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: JULY 28 1986 DATE REPORT MAILED: Aug 1/86 ASSAYER. *D. Toye* DEAN TOYE. CERTIFIED B.C. ASSAYER.

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN.FE.CA.P.CR.MG.BA.TI.B.AL.NA.K.W.SI.ZR.CE.SN.Y.NB AND TA. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: ROCK CHIPS AU1 ANALYSIS BY AA FROM 10 GRAM SAMPLE.

ASSAYER: *D. Toye* DEAN TOYE. CERTIFIED B.C. ASSAYER.
