OF

INTERPRETEX RESOURCES

CARIBOO BELL GEOPHYSICAL INTERPRETATION
OF
VLF EM, MAGNETIC AND INDUCED POLARIZATION SURVEYS

1. SURVEY SPECIFICATIONS

1.1 Survey Parameters

- survey line separation - 100 and 200 meters as per plan map
- survey station spacing - 12.5 meters for all VLF EM and magnetic survey
  - 25 meters for all induced polarization survey
- horizontal control - lines were surveyed by compass and hip chain with estimated slope corrections
  - semi-recoverable stations were located using felt pen markings on flagging tied to vegetation
  - grid tied in to base line 5000W and to lakes
- baseline direction - north-south
- survey lines were perpendicular to the base line
- readings from Seattle VLF transmitter were recorded on all lines
- readings from Cutler VLF transmitter were also recorded on lines 7500N to 7900N and baseline 5000N
- Induced polarization and resistivity surveys were carried out in three localized areas within the main survey area as follows:
  - Area 9300N to 9800N on lines 9300N, 9500N, 9700N &9800N
  - Area 10600N to 11200N on lines 10600N, 10800N, 11000N &11200N
  - Area 11300N to 11700N on lines 11300N, 11400N, 11500N, 11600N & 11700N
- survey totals:

		VLF EM	
Induced Polarization	Magnetic	Seattle	Cutler
13.250 km.	179.45 km.	172.05 km.	27.625 km.

1.2 Equipment Parameters

VLF Electromagnetic Survey

- Geonics EM-16 used for all survey
- transmitting stations - Seattle, Washington
  - Cutler, Maine
- in-phase (dip angle) and out-of-phase (quadrature) components measured in percent at each station
- direction faced: Seattle - easterly
  Cutler - northerly, southerly on base line

Total Field Magnetic Survey

- measured total magnetic field in gammas using EG & G G-816 proton precession magnetometer
- magnetic variations controlled by EG & G G-856 automatic magnetic base station recording every 30 seconds
- instrument accuracy +/- 1 gamma
- station repeatability better than +/- 3 gammas

...2

Induced Polarization Survey
- Huntec Mk II 7.5 kilowatt transmitter
- Huntec Mk IV time domain receiver
- Interpretex Resources Ltd. 7.5 Kw. engine alternator system
- apparent chargeability measured in milliseconds
- primary voltage measured in millivolts
- apparent resistivity determined in ohm-meters
- dipole spacing a = 25 meters, n = 1 to 6
- pole-dipole method with pole westerly and dipole easterly

1.3 Equipment Specifications - see appendix

2. DATA

2.1 Calculations

VLF Electromagnetic Survey

Fraser Filter values (after Fraser, 1969, reference 1.) were calculated for in-phase readings from the Seattle transmitter for all lines in the area.

Induced Polarization Survey

Apparent resistivity values were calculated using the formula;

$$Pa = 2n(n + 1)PI*a*(V/i)$$

where: n = "n" value of 1 to 6
PI = 3.14
a = electrode separation (meters)
V = observed voltage (millivolts)
i = observed curent (amps)
* = "multiplied by"

Metal Factor values were computed using the formula;

$$MF = (Ma/Pa)*1000$$

where: Ma = apparent chargeability
Pa = apparent resistivity
* = "multiplied by"

Total Field Magnetic Survey

Total field magnetic readings were individually corrected for variations in the earth's magnetic field using magnetic base station values recorded at the same time. The effects of changes in magnetic content of operator's clothing or different batteries used in the magnetometer were controlled by re-occupying operator field base stations at the beginning and end of each day during the survey. An "operator adjust" correction was then applied where applicable.

...3

2.2 Presentation

- Apparent chargeability Fraser Filter values, apparent resistivity Fraser Filter values, magnetic readings and VLF EM Fraser Filter values within localized IP survey areas are presented as computer contours at a scale of 1:5000. Apparent chargeability Fraser Filter values and magnetic readings are presented in the form of 3D plots for visual aids
- VLF EM in-phase readings plus calculated Fraser Filter values are presented in an appendix of this report in the form of tables showing values located with respect to line number and station number
- VLF EM in-phase and out-of-phase readings are presented in profile form on a grid plan map at a scale of 1:5000
- VLF EM Fraser Filter contours (positive values only) are presented on a grid plan map at a scale of 1:5000
- operator adjust values used in magnetic data corrections are presented with respect to operator name and survey date in an appendix of this report
- magnetic field and base station values are presented in the form of tables on "Total Field Magnetic Data Corrections Worksheets" in an appendix of this report
- total field magnetic values were computer contoured at 250 gamma intervals on a grid plan map at a scale of 1:5000
- IP data and calculated values are presented in an appendix of this report as "Induced Polarization Data Calculation Worksheets"
- IP data are presented as contoured pseudosections on pseudosection maps at a scale of 1:1250
- IP anomalies are presented on the pseudosection maps and Geophysical Interpretation Map as rectangles
- a geophysical interpretation is presented on a Geophysical Interpretation Map at a scale of 1:5000.

3. INTERPRETATION

3.1 Discussion of Results

On this project topography varied from flat to severe in a few cases, thus at times a topographic effect is evident in some VLF EM data in the form of a positive bias in the readings when facing up hill and a negative when facing down hill. Most of the effect of topography is filtered out when the Fraser Filter is applied to the in-phase data. Both the filtered values and VLF EM profiles were used in this report to interpret the VLF EM data on all lines. Character matching and contours provided the means for continuing conductive trends. Overburden was not considered a problem in this region because of the shallow depth as evidenced by the prevalence of float boulders and some outcrop.

VLF EM data was accummulated using both the Seattle and Cutler transmitting stations until it was recognized that the Cutler data was redundant when using station intervals of 12.5 meters on east-west lines with line separations of 100 and 200 meters. In order to properly utilize Cutler VLF EM values additional stations would have been required between survey lines in order to provide suffucient data

...4

density for meaningful results. Therefore VLF EM survey was continued at 12.5 meter station intervals using only the Seattle transmitting station. Except for base line data, Cutler results were not utilized.

Magnetic data were generally active in most of the area. Station to station variations within 12.5 meters were often of the order of 100 gammas or more and in some cases of the order of 500 gammas or more. In the present area a total of five different magnetometer operators using two different G-816 magnetometers were employed over a period of approximately three months to gather magnetic data. For this reason operator adjust values can be seen to be variable and, in some cases, higher than normally expected. Total field values ranged from around 54,000 gammas to over 69,000 gammas in magnetically active areas.

Induced polarization data were noise free except in minor cases where poor contact reduced signal to noise ratio and required extra time and repeated readings in order to obtain reliable values. Chargeability readings ranged from less than 3.0 milliseconds to greater than 100 milliseconds (single point) with anomalous threshold considered to be 12.5 milliseconds. In some cases negative IP effects can be seen adjacent to positive anomalies. Repeated check readings demonstrated that the negative readings were valid. All relatively large chargeability readings (168 mS., 93 mS., etc.) which can be seen on some survey lines have been checked and duplicated in the field and are therefore considered to be valid.

Apparent resistivity values ranged from under 100 ohm-meters to over 4,000 ohm-meters. Topographic influence was not readily apparent in resistivity data in this region.

3.2 Conclusions

3.2.1 General

Geophysical surveys have delineated a network of structural features, shown regions which probably contain significant amounts of magnetite and/or pyrrhotite and have outlined localized areas which contain anomalous amounts of disseminated sulphides.

Major structural trends seem to strike towards the northwest in the northern half of the area and more northerly or possibly slightly northeast in the southern half. In addition to the above structure, a cross cutting fault has been interpreted, in the vicinity of line 8400N, sub-parallel to survey lines. The fault was interpreted on the basis of VLF EM conductor offsets and magnetic contour perturbations. No VLF EM response was observed due to the shallow angle of incidence where survey lines crossed the interpreted position of the postulated fault.

3.2.2 VLF Electromagnetic Survey

The VLF EM survey, with a station interval of 12.5 meters, delineated a

...5

multitude of EM anomalies and resulted in the interpretation of a large number of conductor systems. Generally the stronger and longer strike length conductors are found in the north half of the area. Based on prior knowledge, there does not seem to be a direct relationship between VLF EM conductivity and economically mineralized zones, although some appear to pass through mineralized areas. Most conductivity is believed to represent a network of interrelated structure such as primary and secondary complimentary faults. In the case of stronger systems, the stronger VLF EM anomalies may result from the presence of sulphides within and controlled by the structural features. Some conductor systems appear to show strike offsets or abrupt changes in direction. This may be due to cross cutting faults which are at shallow angles with respect to survey lines and therefore can not be detected by the present VLF EM survey. An example of a cross cutting fault is interpreted on the Geophysical Interpretation Map as an "inferred fault zone" and is labeled "F".

Certain conductors systems, deemed important, have been labeled for more detailed discussion. Unlabeled conductors and anomalies are probably due to minor structure or surface material such as clay layers. Weak short features are probably all due to overburden conductivity or tight wet fractures in bedrock.

Conductor "A"

The longest conductor system in this area has been labeled "A". This system correlates with a long magnetic lineation and is interpreted as a conductive regional fault. Various anomalies along the system show moderate to strong response. These stronger anomalies probably reflect the presence of more conductive material within the fault zone with possibly a greater depth extent. Near the southern extremity of "A" the strike of the system changes towards a more southerly direction and then appears to break up into shorter northwest trending conductive zones before ending, possibly due to a transition into different rock type and perhaps different force directions. Magnetic contour trends also show the same southward change.

In the vicinity of survey lines 9700N to 10600N conductor "A" appears to split into two parallel zones. The weaker offshoot conductor is labeled "A1" and partially follows a magnetic lineation slightly west of "A". This split probably reflects a double break or two conductive edges of a wide fault zone. Another nearly parallel conductor, labeled "A2", is also believed to be related to the main regional fault. At approximately line 9400N a third split seems to occur with conductor "A3" diverging more towards the north, away from the main zone "A". Conductor "A3" follows a magnetic trend near and sub-parallel to base line 5000N. A number of strong anomalies in "A3" indicate that this system may represent a significant break with portions of the structure possibly containing sulphide mineralization. An interpretation of a relationship between "A", "A1", "A2" and "A3" suggests that the postulated regional fault ("A") widens towards the north and ultimately splits apart into a number of sub-parallel and diverging fault zones while in the south the fault tightens up and finally ends as a narrow discontinuous feature.

...6

Conductor "B"

The multiple conductor system "B" is also interpreted as a regional structural feature although it is discontinuous, has indefinite magnetic support and, at one point, becomes non-conductive. System "B" does, however, contain a number of strong and therefore noteworthy anomalies. Although the conductivity-thickness product (conductance) is only moderate, these anomalies may represent long (of the order of 300 meters or more) and deeply extending narrow zones of sulphide mineralization within the faults. A northwesterly trending conductor, labeled "B1", is coincident with a subtle magnetic lineation, contains some moderate and strong anomalies and appears to join the main "B" group of conductors, suggesting a related structural feature possibly containing sulphides.

Conductor "C"

System "C" appears to be a complex series of conductors, many with strong anomaly amplitudes. Anomalies in system "C", between approximately lines 9000N and 9600N, show higher conductance than on most other conductor systems in the area. This is believed to represent a zone of conductive massive sulphides which is wider than in other cases. The discontinuous nature of the conductive trends and what appear to be intersecting faults, or fault zones which seem to splay off from the main trend, may mean that larger cavities were formed in this area resulting in accumulation of wider zones of conductive mineralization. EM profile character has suggested an unusual strike change from the northwesterly direction, resulting in the interpretation of conductors "C1" and "C2" striking towards the northeast. Although conductor "C3" does not connect with "C", its similar character and strike direction suggest it is related geologically. As conductor "C1" continues northeast from "C" profile character again indicates a swing back towards the northwest, to nearly parallel, and perhaps link up with conductor "A". This phenomenon again suggests that most of the conductors in this area represent a network of conjugate structural features.

3.2.3 Total Field Magnetic Survey

The total field magnetic survey in the present area has shown two general magnetic environments, one relatively inactive and the other more active. A change in magnetic background in the vicinity of line 7300N is roughly delineated on the interpretation map and shown as "-M-". The magnetic background level in the southern portion of the survey area (south of the "-M-" line) is lower than in the north up until another level change (also shown as "-M-") again takes place, back down to a lower level. A small "active area" is outlined (with the symbol "-M-") in the northeast between lines 9800N and 10800N.

Both the level of magnetism and the general magnetic activity (the number of magnetic anomalies present and their strength) in the "active areas" are greater than in the "low level" areas. This probably indicates a rock type change from more magnetic rock containing more magnetite in the higher magnetic background areas, to less magnetic rock

...7

containing fewer occurrences of magnetic minerals, such as magnetite, in the less magnetically active areas. (Large magnetic anomalies within the "active" area are believed to be due to local occurrences of magnetite.)

An unusual magnetic low, unique in this survey area, is found within the interpreted magnetically "lower level" region, on line 6800N in the vicinity of 4500W to 4800W. Model studies suggest that the magnetic low feature is caused by natural remanent magnetism with a direction of magnetization approximately opposite to the present earth's magnetic field. Study of the large amplitude and curve shape of the negative anomaly indicates, through model calculations, that the cause could be a narrow ultrabasic dyke or rock unit containing magnetite, trending parallel to line 6800N from approximately 4550W to about 4800W. Assuming that the model used is reasonable, the depth seems to vary from near surface (of the order of 10 meters or less) near 4800W, to about 50 meters around 4700W and then to perhaps 25 meters in the vicinity of 4550W.

A single line magnetic high anomaly, also in the "low level" region is evident in the north part of the survey area on line 12200N from 5600W to 5700W. This anomaly is probably due to a local near surface occurrence of magnetic material related to magnetic anomalies within the "active areas".

3.2.4 Induced Polarization and Resistivity Survey

Negative IP effects can be seen on a few lines, within the areas surveyed. These negative values are possible and not abnormal near bodies of limited lateral extent. The negative response is due to the vectorial electrical field relationships of a polarizable body during the polarizing (current on) and depolarizing (current off) cycles of current transmission and the position of receiver electrodes with respect to the target body. (reference 2.)

Little use was made of metal factor values in the present interpretation because of the favourable relationship between apparent chargeability highs and apparent resistivity highs rather than the normal inverse relationship. Metal factor calculations are designed to enhance the inverse relationship between apparent chargeability and apparent resistivity.

The three localized areas in which IP survey was carried out are discussed in more detail below:

Area 9300N to 9800N

This region was surveyed first to determine an IP signature over known disseminated sulphide mineralization. Line 9700N was extended to cover a barren pyrite occurrence, in the vicinity of 5700W to 5900W, to see if a difference in signature between the barren pyrite and gold bearing mineralization could be observed. It was found that although both sulphide occurrences gave a good apparent chargeability response, the

...8

barren pyrite zone high chargeability was accompanied by an apparent resistivity low, whereas anomalous chargeability from the economic mineral occurrence was associated with an apparent resistivity high. It was also noted that the economic zone of interest also correlated with a large magnetic high anomaly. Magnetite is believed to be responsible for the increase in resistivity in the economically interesting zone containing high apparent chargeability values. A simplified exploration rule (possibly over-simplified) would then be to place a higher priority on chargeability anomalies which are accompanied by higher than background apparent resistivity and a lower priority on apparent chargeability values which correspond with apparent resistivity lows.

Using the above evaluation rule the following locations are given a high priority for follow-up exploration: (along with a rudimentary interpretation based on model study theoretical pseudosection contours and a simplified assignment of "rank" within the high priority targets)

LINE #	LOCATION (westing)	APPROX. DEPTH (meters)	ATTRIBUTE	POSS. GEOMETRY	RANK
9300N	5100 - 5175	50 - 75	weak	unstructured zone	3
"	5750 - 5760	> 50	weak	" "	3
9500N	5075 - 5125	surface	moderate	dyke-like - narrow	3
"	5150 - 5200	"	"	thin layer zone	2
"	5325 - 5375	approx. 50	weak	dyke-like dips W?	3
"	5750 - 5800	surface	moderate	unstructured zone	2
9700N	5050 - 5075	> 25	weak	undefined	3
"	5250 - 5375	surface	strong	unstructured zone	1
"	5650 - 5675	"	strong	dyke-like dips W?	1
9800N	5025 - 5050	approx. 25	weak	undefined	3
"	5300 - 5450	> 25	weak	unstructured zone	3
"	5450 - 5500	surface	moderate	thin layer zone	2
"	5550 - 5600	approx. 25	weak	unstructured zone	2

Area 10600N to 11200N
Only three anomalies (using an apparent chargeability anomalous threshold of 12.5 milliseconds) were observed in this IP investigation area. All three apparent chargeability anomalies correspond with apparent resistivity lows and thus have not been listed as priority targets.

Area 11300N to 11700N
All of the strong apparent chargeability anomalies in this IP investigation area have nearby negative chargeability values. This suggests that these anomalies are of limited lateral extent as per previous discussion.

...9

The following apparent chargeability anomaly locations are considered targets for economic mineralization:

LINE #	LOCATION (westing)	APPROX. DEPTH (meters)	ATTRIBUTE	POSS. GEOMETRY	RANK
11300N	5225 - 5250	25 - 50	weak	small unstructured	3
11400N	5250 - 5300	surface	"	thin layer zone	3
11600N	4800 - 4875	< 25	"	dyke-like perp dip?	3
11700N	4850 - 4900	> 50	strong	small unstructured	1

Other strong apparent chargeability anomalies in this region are believed to contain sulphide mineralization but were not listed as priority targets due to the lack of corresponding higher apparent resistivity.

4. RECOMMENDATIONS

VLF EM conductor systems interpreted as structure may be genetically related to economically mineralized zones and therefore the stronger conductors are recommended for follow-up both to determine mineral content and to explore their relationship to larger zones of disseminated gold bearing sulphides.

Intense magnetic high anomalies, interpreted as magnetite, appear to be related to gold mineralization and therefore any significant magnetic high anomalies which have not been adequately explored are recommended for detailed IP survey coverage to determine if dissemminated sulphide mineralization exists. The unusual magnetic low, found mainly on line 6800N should be investigated to confirm the cause of the large magnitude of the magnetic low and to determine if significant mineralization exists.

Generally the higher priority IP targets, defined above in Section 3.2.4, are considered important for follow-up exploration. These higher priority targets have been given a "rank" to further define priorities for continued work. The apparent chargeability anomalies not listed, due to the absence of coincident higher apparent resistivity values, are also considered targets for additional exploration pending support from favourable geochemical and geological information.

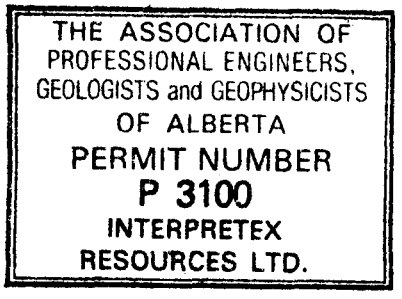
Consulting Geophysicist



CERTIFICATE

I, Edwin Ross Rockel, Geophysicist of Vancouver, British Columbia, Canada, hereby certify that:

1. I received a B.Sc. degree in Geophysics from the University of British Columbia in 1966.

2. I have been practising my profession since graduation.

3. I am a Professional Geophysicist registered in the Province of Alberta.

4. I am a Professional Engineer registered in the Province of Saskatchewan.

5. I hold no direct or indirect interest in, nor expect to receive any benefits from, the mineral property or properties described in this report.

6. This report may be used for the development of the property, provided that no portion will be used out of context in such a manner as to convey meanings different from that set out in the whole.

7. Consent is hereby given to the company for which this report was prepared to reproduce the report or any part of it for the purposes of development of the property, or facts relating to the raising of funds by way of a prospectus and/or statement of material facts.

Date: Dec. 31, 1986 Signed: _____

Vancouver,
British Columbia

Edwin Ross Rockel

VANGEOCHEM LAB LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED, *AU= AQUA REGA/AAS

COMPANY: E & B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO#5586

REPORT#: 860510PA
JOB#: 860510
INVOICE#: 860510NA

DATE RECEIVED: 86/10/06
DATE COMPLETED: 86/10/09
COPY SENT TO: VANCOUVER OFFIC

VANGEOCHEM LAB LIMITED

M: IN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED, *AU= AQUA REGA/AAS

COMPANY: E & B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO#5586

REPORT#: 860507PA
JOB#: 860507
INVOICE#: 860507NA

DATE RECEIVED: 86/10/03
DATE COMPLETED: 86/10/07
COPY SENT TO: VANCOUVER OFFIC

ANALYST W. Reeves

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN.FE.CA.P.CR.MG.BA.TI.B.AL.NA.K.W.SI.ZR.CE.SN.Y.NB AND TA. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: ROCK CHIPS AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

DATE RECEIVED: SEPT 23 1986 DATE REPORT MAILED: Sept 30/86 ASSAYER D. Toye ..DEAN TOYE. CERTIFIED B.C. ASSAYER.

VANGEOCHEM LAB LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED, *AU= GEOCHEM

COMPANY: E & B EXPLORATIONS
ATTENTION:
PROJECT: 5061-CB PO#5589

REPORT#: 860435PA
JOB#: 860435
INVOICE#: 860435NA

DATE RECEIVED: 86/09/03
DATE COMPLETED: 86/09/16
COPY SENT TO:

GEOCHEMICAL ICP ANALYSIS

.500 GRAM SAMPLE IS DIGESTED WITH 3ML 3-1-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN.FE.CA.P.CR.MG.BA.TI.B.AL.NA.K.W.SI.ZR.CE.SN.Y.NB AND TA. AU DETECTION LIMIT BY ICP IS 3 PPM.
- SAMPLE TYPE: SOILS -80MESH AU* ANALYSIS BY AA FROM 10 GRAM SAMPLE.

ASSAYER: D. Toye. DEAN TOYE. CERTIFIED B.C. ASSAYER.

VANGEOCHEM LAB LIMITED

Paul Sterling

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED, *AU= AQUA REGA/AAS

COMPANY: E & B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO#5612

REPORT#: 860471PA
JOB#: 860471
INVOICE#: 860471NA

DATE RECEIVED: 86/09/17
DATE COMPLETED: 86/09/26
COPY SENT TO: VANCOUVER OFFIC

ANALYST W. Reeves

VANGEOCHEM LAB LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. 1S= INSUFFICIENT SAMPLE. ND= NOT DETECTED. -= NOT ANALYZED. +AU= GEOCHEM

COMPANY: E&B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO#5532

REPORT#: 860358PA
JOB#: 860358
INVOICE#: 860358NA

DATE RECEIVED: 86/08/06

VANGEOCHEM LAB LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED. *AU= GEOCHEM

COMPANY: E&B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO# 5546

REPORT#: 860375PA
JOB#: 860375
INVOICE#: 860375NA

DATE RECEIVED: 86/08/18
DATE COMPLETED: 86/08/26
COPY SENT TO: VANC.OFFICE

GEOCHEMICAL ANALYTICAL REPORT

CLIENT: E & B EXPLORATIONS LIMITED
ADDRESS: 1440 - 800 W. Pender St.
: Vancouver B.C.
: V6C 2V6

DATE: Aug 12 1986
REPORT#: 8603506A
JOB#: 860350

PROJECT#: 5061 - CARIBOO BELL
SAMPLES ARRIVED: Aug 6 1986
REPORT COMPLETED: Aug 12 1986
ANALYSED FOR: Au (FA/AAS)

INVOICE#: 860350NA
TOTAL SAMPLES: 5
SAMPLE TYPE: 5 ROCK
REJECTS: SAVED

SAMPLES FROM: E & B EXPLORATIONS LIMITED
COPY SENT TO: E & B EXPLORATIONS LIMITED

PREPARED FOR: J. BELLAMY & L. SALEKEN

ANALYSED BY: VGC Staff

SIGNED: 

GENERAL REMARK: None

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

COMPANY: E&B EXPLORATIONS

VANGEOCHEM LAB LIMITED

Paul Sterling

1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
E: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED. *AU= GEOCHEM

T: E & B EXPLORATIONS
ION: L.SALEKEN & M.TINDALL
CT: 5061-CB PO#5587

ASSAY ANALYTICAL REPORT

CLIENT: MASCOT GOLD MINES LTD.
ADDRESS: 1440 - 800 W. Pender St.
: Vancouver, B.C.
: V6C 2V6

DATE: Sept 16 1986
REPORT#: 860464 AA
JOB#: 860464

PROJECT#: 5061 - Cariboo Bell
SAMPLES ARRIVED: Sept 16 1986
REPORT COMPLETED: Sept 16 1986
ANALYSED FOR: W

INVOICE#: 860464 NA
TOTAL SAMPLES: 3
REJECTS/PULPS: 90 DAYS/1 YR
SAMPLE TYPE: 3 ROCK PULP

SAMPLES FROM: VGC file 860411
COPY SENT TO: MASCOT GOLD MINES LTD.

PREPARED FOR: MASCOT GOLD MINES LTD.

ANALYSED BY: David Chiu

SIGNED: _____

VANGEOCHEM LAB LIMITED

Paul Sterling

M. IN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10ML WITH WATER. IS= INSUFFICIENT SAMPLE. ND= NOT DETECTED. -= NOT ANALYZED. *AU= AQUA REGA/AAS

COMPANY: E & B EXPLORATIONS
ATTENTION: L.SALEKEN & M.TINDALL
PROJECT: 5061-CB PO#5600

REPORT#: 860441PA
JOB#: 860441
INVOICE#: 860441NA

DATE RECEIVED: 86/09/05
DATE COMPLETED: 86/09/24
COPY SENT TO: VANCOUVER OFFIC

ANALYST W. Rowles
