GEOLOGICAL BRANCH  
ASSESSMENT REPORT

Geochemical Report  
KAM AND JEFF PROSPECT  
Sabiston Creek, Kamloops Mining Division.

SUMMARY

The Kam property, situated on Sabiston Creek, on the north shore of Kamloops Lake includes the Kam claims, 12 claims totalling 202 units and the Jeff claims, 6 two-post claims, included within the Kam claim block. The claims are owned by Canadian Nickel Company Ltd, and Emerald Star Mining Explorations Ltd. may earn a 50 % interest in the claims under a joint-venture agreement.

Around the turn of the century, the property was explored for mercury; numerous mercury prospects occur in a belt extending northwestward from Tunkwa Lake, south of Savona B.C. to Criss Creek, north of the Kam property. Placer gold was produced from Criss Creek and Deadman River, north and west of the Kam property, and Tranquille Creek to the east.

The property is situated in a northwesterly-trending feature known as the Quesnel Trough, filled mainly with basic to ultramafic Nicola volcanics, of late Triassic age, and characterized by gold deposits on the margins and copper-gold porphyry deposits within the central part. Mercury deposits in the Kamloops lake area are associated with north-west trending faults thought to be an extension of the Pinchi Fault, which hosted British Columbias most productive mercury deposit.

On the Kam property, Canadian Nickel Company has expended at least \$140,000 from 1982 to 1985 in the search for epithermal precious metal deposits associated with the extensive silica - carbonate alteration zones along major faults. Angular gold particles occur in till on the property, and are believed to have originated within 2 km. Percussion drilling and two diamond drill holes have not defined the source of the gold.

A large proportion of the property remains unexplored. Scattered anomalous gold values in rock are associated with mercury, arsenic, and antimony in association with granitoid intrusions and with faults along the contact of Nicola volcanics with younger conglomeratic units deposited in a fault graben.

A program of geological mapping and soil sampling was completed in late May and early June in 1987 to try and delineate areas where further exploration could effectively concentrate. The program was successful in outlining zones of cinnabar mineralization in carbonatized ultramafics or andesite volcanics of the Nicola Group, in fault contact with Nicola sedimentary units. Large areas with rusty soils coincide with zones of maximum alteration.

A total of 1132 soil and rock samples (1109 soils and 23 rocks), were taken by the writer, Geologists Carol I Ditson, B.Sc., Les Demczuk, (M.Sc.Equiv.) and sampler P.Boldon, between May 23 and June 10, 1987. The samples were taken along an extensive road system and on four separate small reconnaissance style grids. Samples were analysed for 30 elements by Vangeochem Labs Ltd., using ICP analytical method. Results for copper, silver, arsenic, antimony are shown on a series of maps which accompany this report.

On the road systems, soil samples taken at 50 meter intervals indicate large areas of moderately anomalous copper (100-200 ppm), with smaller areas where silver is weakly anomalous. These areas do not coincide. Weak arsenic and antimony anomalies are, however coincident.

Four geochemical grids all have large diffuse soil anomalies with moderate to high mercury. The anomalies coincide with silica carbonate altered serpentinized ultramafics along northwest fault zones. Copper anomalies of lesser extent and magnitude have scattered weakly to moderately anomalous arsenic. Gold values on the grids vary from 0 to 30 ppb. Values from 20-30 ppb are considered weakly anomalous.

Additional soil sampling at greater depths in the profile may help to define mineralized areas. Percussion drilling within the main anomalies is recommended, with diamond drilling to follow, if results warrant.

respectfully submitted

  
Barry Price, M.Sc.  
Consulting Geologist.

LOCATION AND ACCESS:

The Kam and Jeff claims are situated in the Intermontane Physiographic province of British Columbia, approximately 40 kilometers northwest of Kamloops and directly north of Savona on the opposing shore of Kamloops Lake (refer to figure 1).

The claim group encompasses most of Eagle Hill and portions of the northeastern and southern slopes of Mount Uren. The property lies along the Sabiston Creek drainage and includes Copper Creek, Sabiston Lake and most of Sedge Lake.

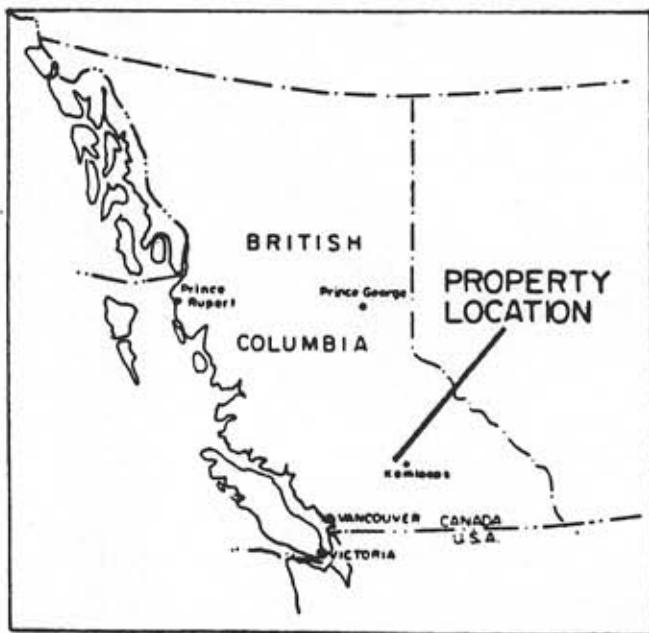

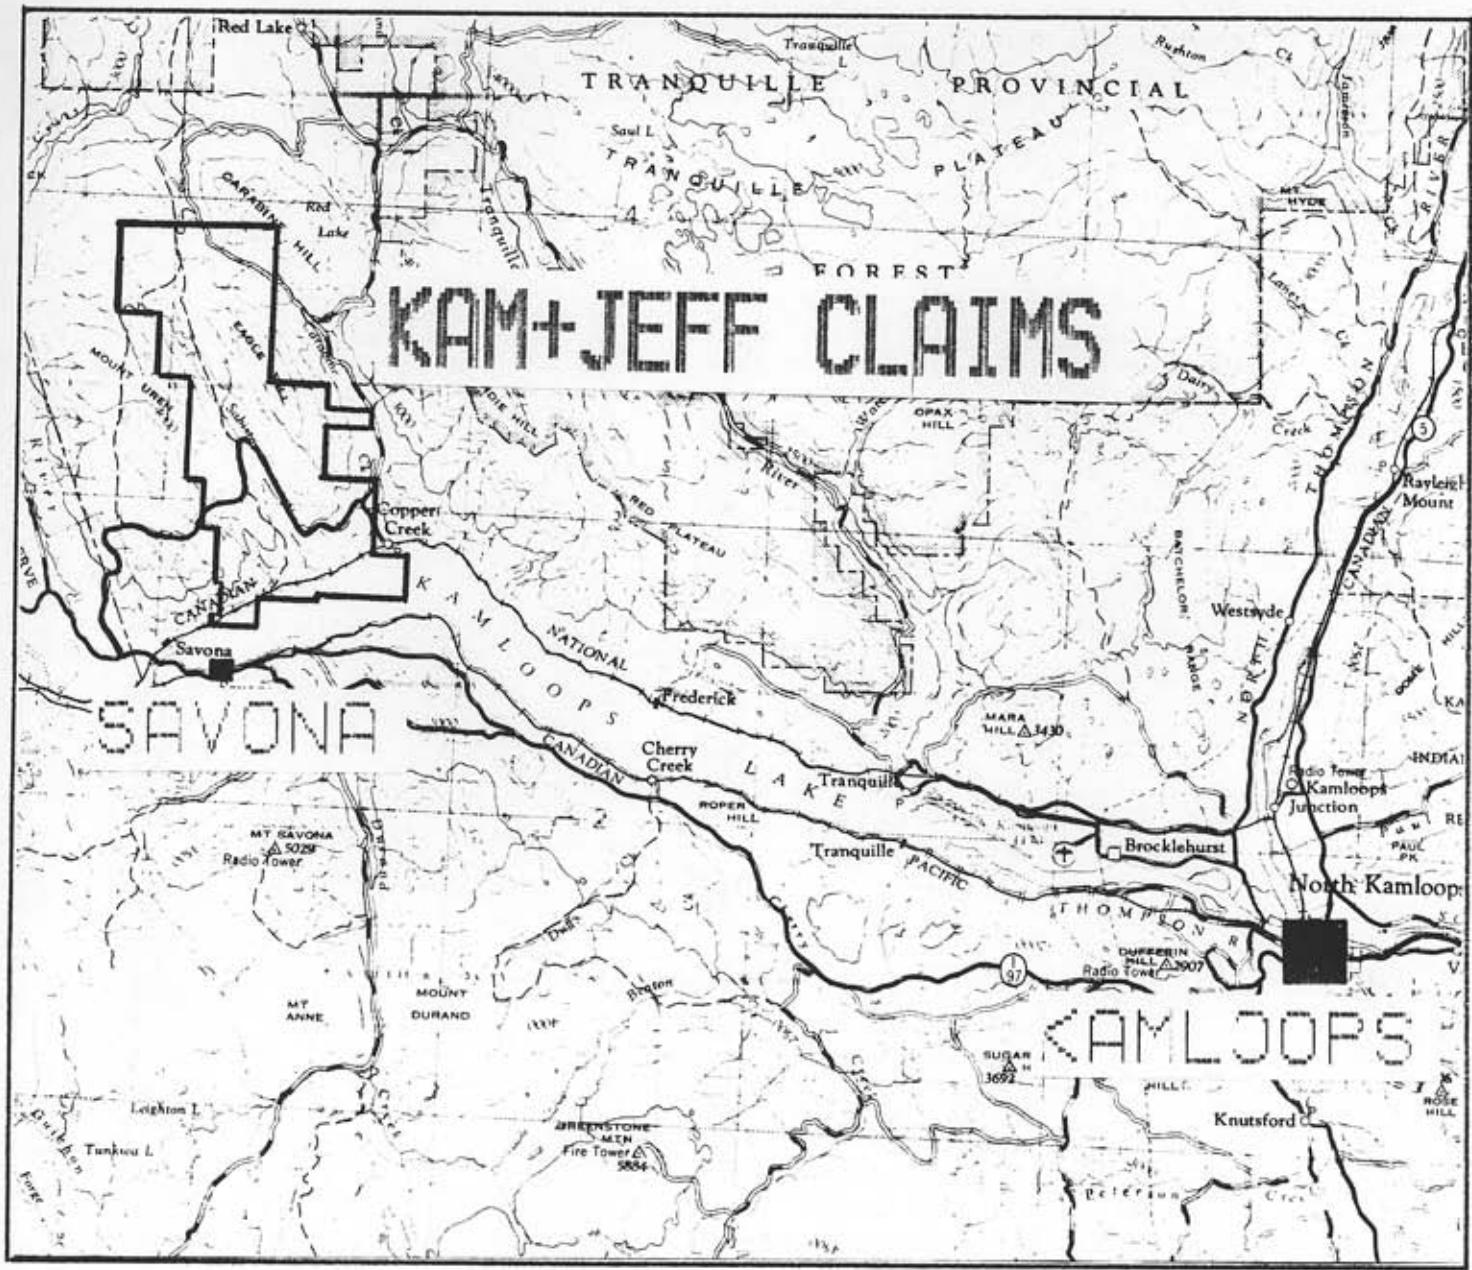

Access is via the Sabiston Creek gravel road, which extends from the Trans Canada Highway, about 1 km west of the bridge over the Thompson River, 3 km west of Savona B.C.

The gravel road heads northerly, then westerly, for a distance of about 12 kilometers to the western edge of the Kam 20 claim, then continues through the southern part of the property to the Railway siding at Copper Creek, on the shore of Kamloops Lake.

An extensive network of other secondary roads provides good access to most other portions of the property with the exception of Eagle Hill. Four-wheel drive is recommended for some of the roads because of mud in wet weather.

The property can be reached in about 4 hours driving time from Vancouver or 1 hour from Kamloops. All necessary supplies and services are available from Kamloops, which is serviced by several flights a day from Vancouver.

Surface rights to the property are owned by Indian Garden Ranch, near Savona, B.C.

**FIGURE 2**

**TOPOGRAPHY IN**

**KAM CLAIM AREA**

921-15W

B.J.Price, M.Sc. 1986

PHYSIOGRAPHY, VEGETATION AND CLIMATE:

Topography on the Kam and Keff claims varies from gently sloping to locally very steep, particularly approaching the shores of Kamloops Lake. Elevations range from 350 meters at the lakeshore to 1450 meters atop Eagle Hill. The Sabiston Valley, wide and U-shaped at its headwaters, becomes steeply V-shaped as it approaches Kamloops Lake. Sabiston creek is the only water course on the property which contains running water year around.

Much of the claim area is heavily wooded with spruce, pine, hemlock, aspen and birch. At lower elevations, on slopes bordering Kamloops Lake, the area is desert-like with grass, sagebrush, cactus and sparse mature pine, primarily in stream valleys. The claim area is used as open cattle range.

Climate is arid, with temperatures to 38 degrees in summer, and moderately cold in winter. Work could continue late in the season on showings at lower elevations adjacent to the lake.

During the summer, water for drilling must be trucked or pumped from one of the lakes.

PROPERTY DEFINITION:

The claims, Kam 3-4, 15-24 and Jeff 1-6 are situated in the Kamloops Mining District. The Kam claims, staked using the modified grid system, consist of 202 units. The Jeff claims are 2-post claims, totalling 6 unit equivalents.

The property is held by Emerald Star Mining Company Ltd. under an option leading to a joint-venture agreement with the original owner; Canadian Nickel Company Ltd.

Claim details are itemized below, a claim map is included as figure 3.

Kam 20	12	4496	June 10, 1983	June 10, 1991
Kam 21	18	4497	June 10, 1983	June 10, 1988
Kam 22	20	4498	June 10, 1983	June 10, 1990
Kam 23	18	4499	June 10, 1983	June 10, 1989
Kam 24	20	4500	June 10, 1983	June 10, 1991
TOTAL	202 units			
Jeff 1	1	5480	February 3, 1984	Feb 3, 1995
Jeff 2	1	5481	February 3, 1984	Feb 3, 1994
Jeff 3	1	5482	February 3, 1984	Feb 3, 1994
Jeff 4	1	5483	February 3, 1984	Feb 3, 1994
Jeff 5	1	5484	February 3, 1984	Feb 3, 1994
Jeff 6	1	5485	February 3, 1984	Feb 3, 1994
TOTAL	6 claims			
<hr/>				

The Kam claims have been regrouped as follows:

Group Name	Includes Claims	Units
Group 1	Kam 19,20,21,22,24,Jeff 1-6	96
Group 2	Kam 3,4,15,16,17,18	94
Ungrouped	Kam 23	18

The claims are shown on British Columbia Department of Mines and Petroleum Resources Mineral Claim Map 92I/15W.

Some of the claims do not actually contain the full number of units represented above as a result of overlap; considerable portions of Kam 21, 22 and 23 extend into Kamloops Lake. In addition, the Jeff claims are located within the Kam 22, 23 and 24 claims and a group of crown grants, the Savona Gold group (Lots 922-930 inclusive), are contained within the Kam 23 and 24 claims.

Figure No. 3

0 1 2 3 km

The Savona Gold Group, mentioned above, does not comprise a portion of the property as ownership is held by other interests.

The south-facing slopes of the claims bordering on Kamloops Lake are considered grazing land and, as such, are operated by the Indian Garden Ranch. The Ranch is located on Tunkwa Lake Road, 4 kilometers south of the Trans Canada Highway, telephone 604-373-2542.

#### HISTORY

Early history of the area was described in an earlier report (Price, 1987), and need not be repeated. More recently, the Kam claims were staked in 1983 by Canadian Nickel Company Ltd., who discovered gold in heavy mineral samples taken from Sabiston Creek.

Recent work on the Sabiston Creek showings has been spurred by the development of new geologic models for epithermal gold-silver deposits in the southwestern United States, and application of this model to exploration for similar deposits in British Columbia and elsewhere in the world.

Exploration personnel from Canico became aware that the numerous hydrothermal mercury occurrences in the area could be a manifestation of zoning in epithermal ("fossil hotspring) gold deposits. Exploration was pursued intensively from 1982 to 1985., as is outlined below. (Quoted from Price, 1987).

1982 Exploration: In 1982, heavy mineral sampling, conducted by Canico yielded several anomalous instances of mercury and gold and resulted in staking of the Kam 1-24 claim group. Total expenditures on the claim block in 1982 are not known.

1983 Exploration: In 1983, Canico conducted extensive work over the above ground and, as a result, the Jeff 1-6 claims were staked and the Kam group reduced to 15 claims.

Exploration included cutting and flagging in excess of 30 km of grid lines, geological mapping, soil sampling (159 samples), rock sampling (84 samples), heavy mineral concentrate sampling (124 samples), at least 20 km of VLF surveys, altimeter surveys, and 7.6 km of IP and Resistivity geophysics.

The 1983 program involved 225 man days of work under the supervision of E.J.Debicki, F.G.A.C., (District Geologist), and W.O.Manson, B.Sc., (Project Geologist) at a total cost of \$58,954.30.

1984 Exploration: In the 1984 and 1985 field seasons, Canico continued exploration to determine the source of gold and mercury anomalies discovered in 1984. Work done in 1984 included: line cutting, prospecting, geological mapping, rock and stream sediment sampling, magnetometer, VLF and IP geophysical surveys, and overburden percussion drilling. In all, 146 man days were spent on the property and total cost of the program was \$72,426.50.

#### REGIONAL GEOLOGY (Figures 4 and 5)

The area of the Kam/Jeff claim group is situated within the Intermontaine Tectonic/physiographic province, bordered by the Fraser-Yalakom fault system on the west and the Louis Creek Fault on the east. The property lies central to this belt, which includes an important geologic feature called the Quesnel Trough.

The Quesnel Trough is a 30-60 kilometer wide belt of north-northeast trending Triassic Nicola Group volcanics and sediments enclosed between older Paleozoic Cache Creek and Harper Valley Formations on the west and east, respectively. The contacts between these units has been invaded by Triassic-Jurassic Coast Intrusions and by the much later Eocene Kamloops Group volcanics. A few patches of Jurassic Ashcroft sediments occur

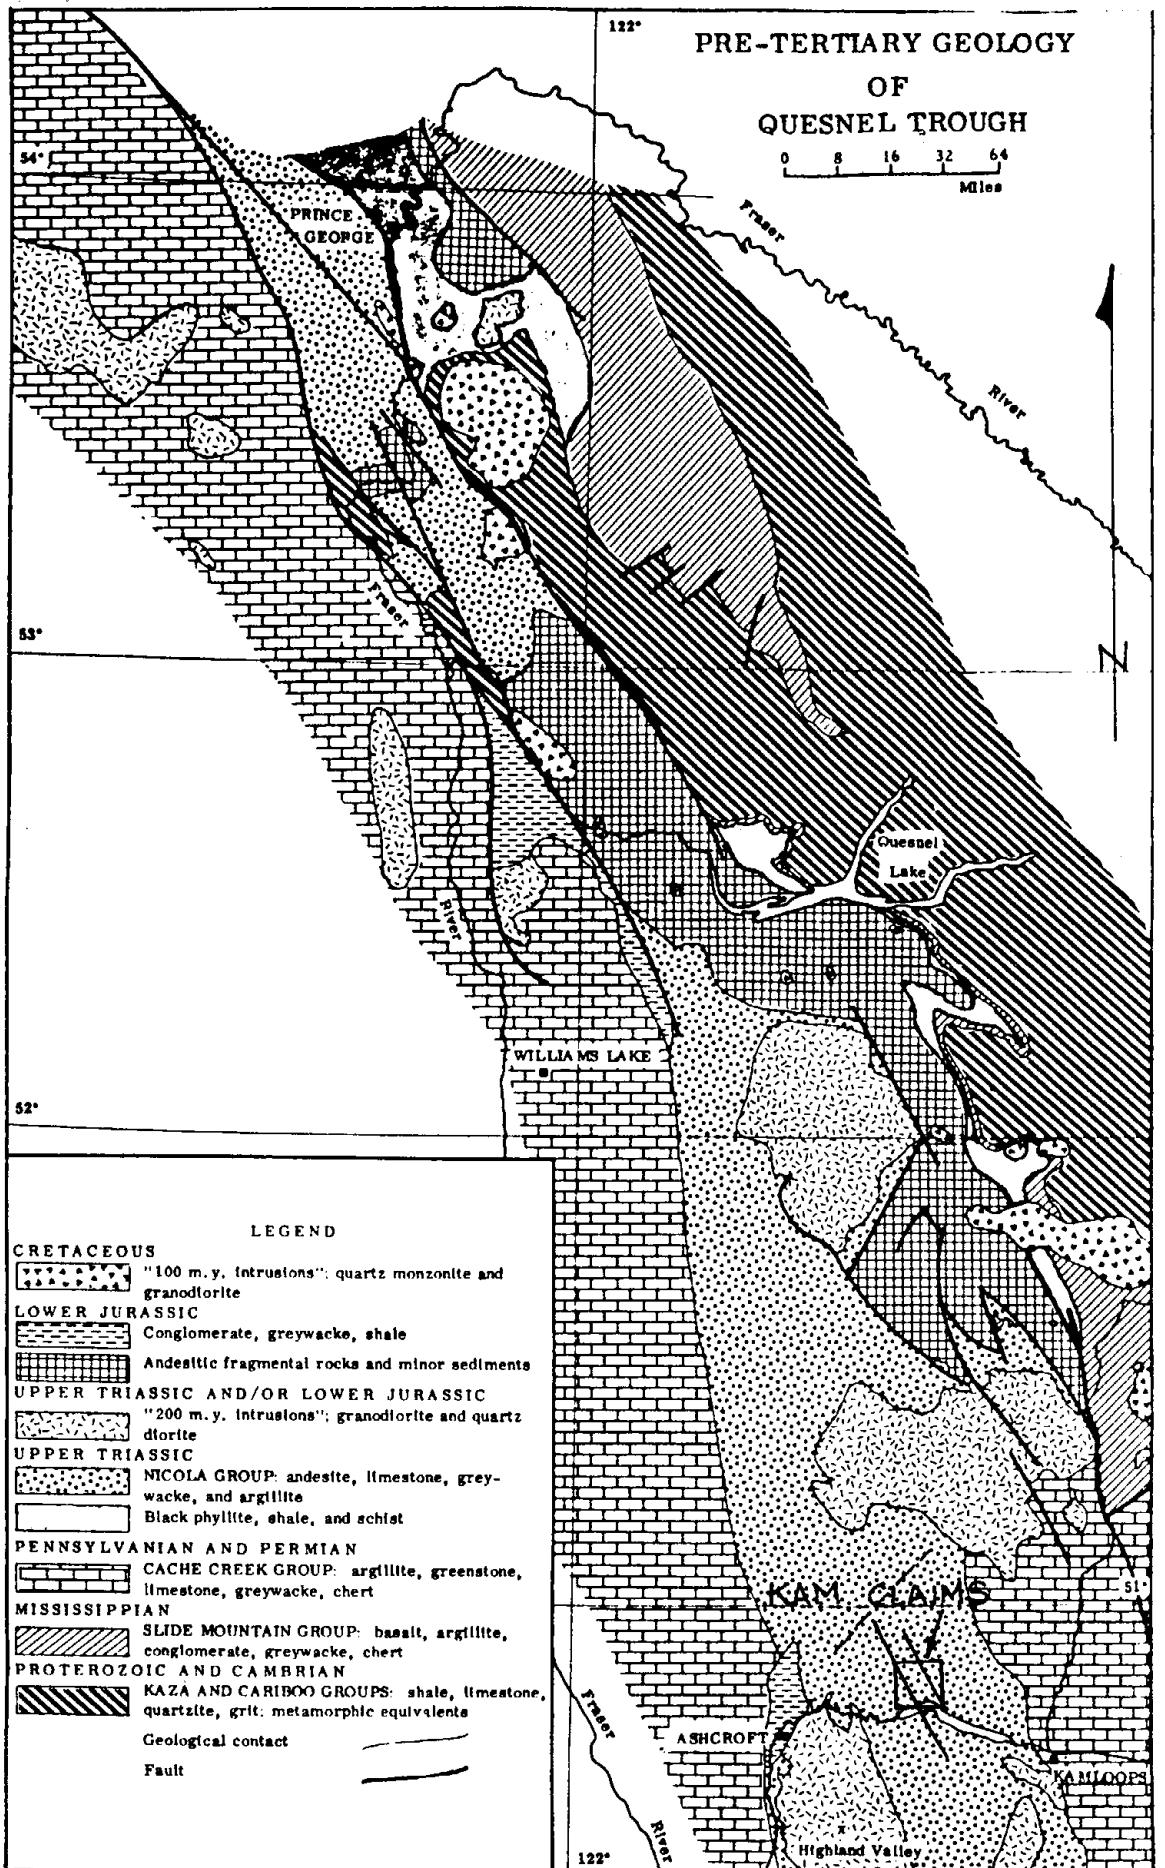

FIGURE 2 — Schematic map of the pre-Tertiary geology of the Quesnel Trough and surroundings. The Trough is defined by the occurrence of Upper Triassic and Lower Jurassic volcanic and sedimentary rocks and is bounded by Paleozoic or older rocks on either side.

FIGURE 4. Regional Geology - Quesnel Trough.

(CIM Bull., July 1970)

sporadically across the map area as do various Cretaceous and/or Tertiary intrusive and extrusive rocks.

Nicola and Ashcroft Formations have been folded and faulted along a north-northwest trending axis. Kamloops group volcanics, which unconformably cap these units, are relatively undeformed.

Mercury deposits, long known in this area, occur in a belt roughly 12 kilometers wide extending from Tunkwa Lake on the south to Criss Creek, a distance of about 36 kilometers. The mercury is present as cinnabar, primarily associated with dolomite in veins and stringers located within shear zones but sometimes occurs as small masses in chalcedony and silicified rock. Host rocks are volcanics of all ages that have been strongly silicified or altered by ankeritic carbonates.

Numerous copper deposits are present in the area, most associated with the Iron Mask Batholith, located only 12 kilometers from the Kam 23 claim. Nearly 200,000 tonnes of material, grading about 1.5% copper, was mined from this district between 1891 and 1928. This included several thousand tonnes of magnetite ore. The Afton Mine, prior to opening in 1975, announced proven ore reserves of 30 million tonnes grading 1% copper, 0.58 ppm gold (0.017 oz./ton), and 4.19 ppm silver, (0.122 oz./ton). The mine is continuing exploration, although the smelter operation is closed pending increased copper price.

Lode gold has been mined at Stump Lake and at Swakum Mountain, located about 35 kilometers southeast and south, respectively,

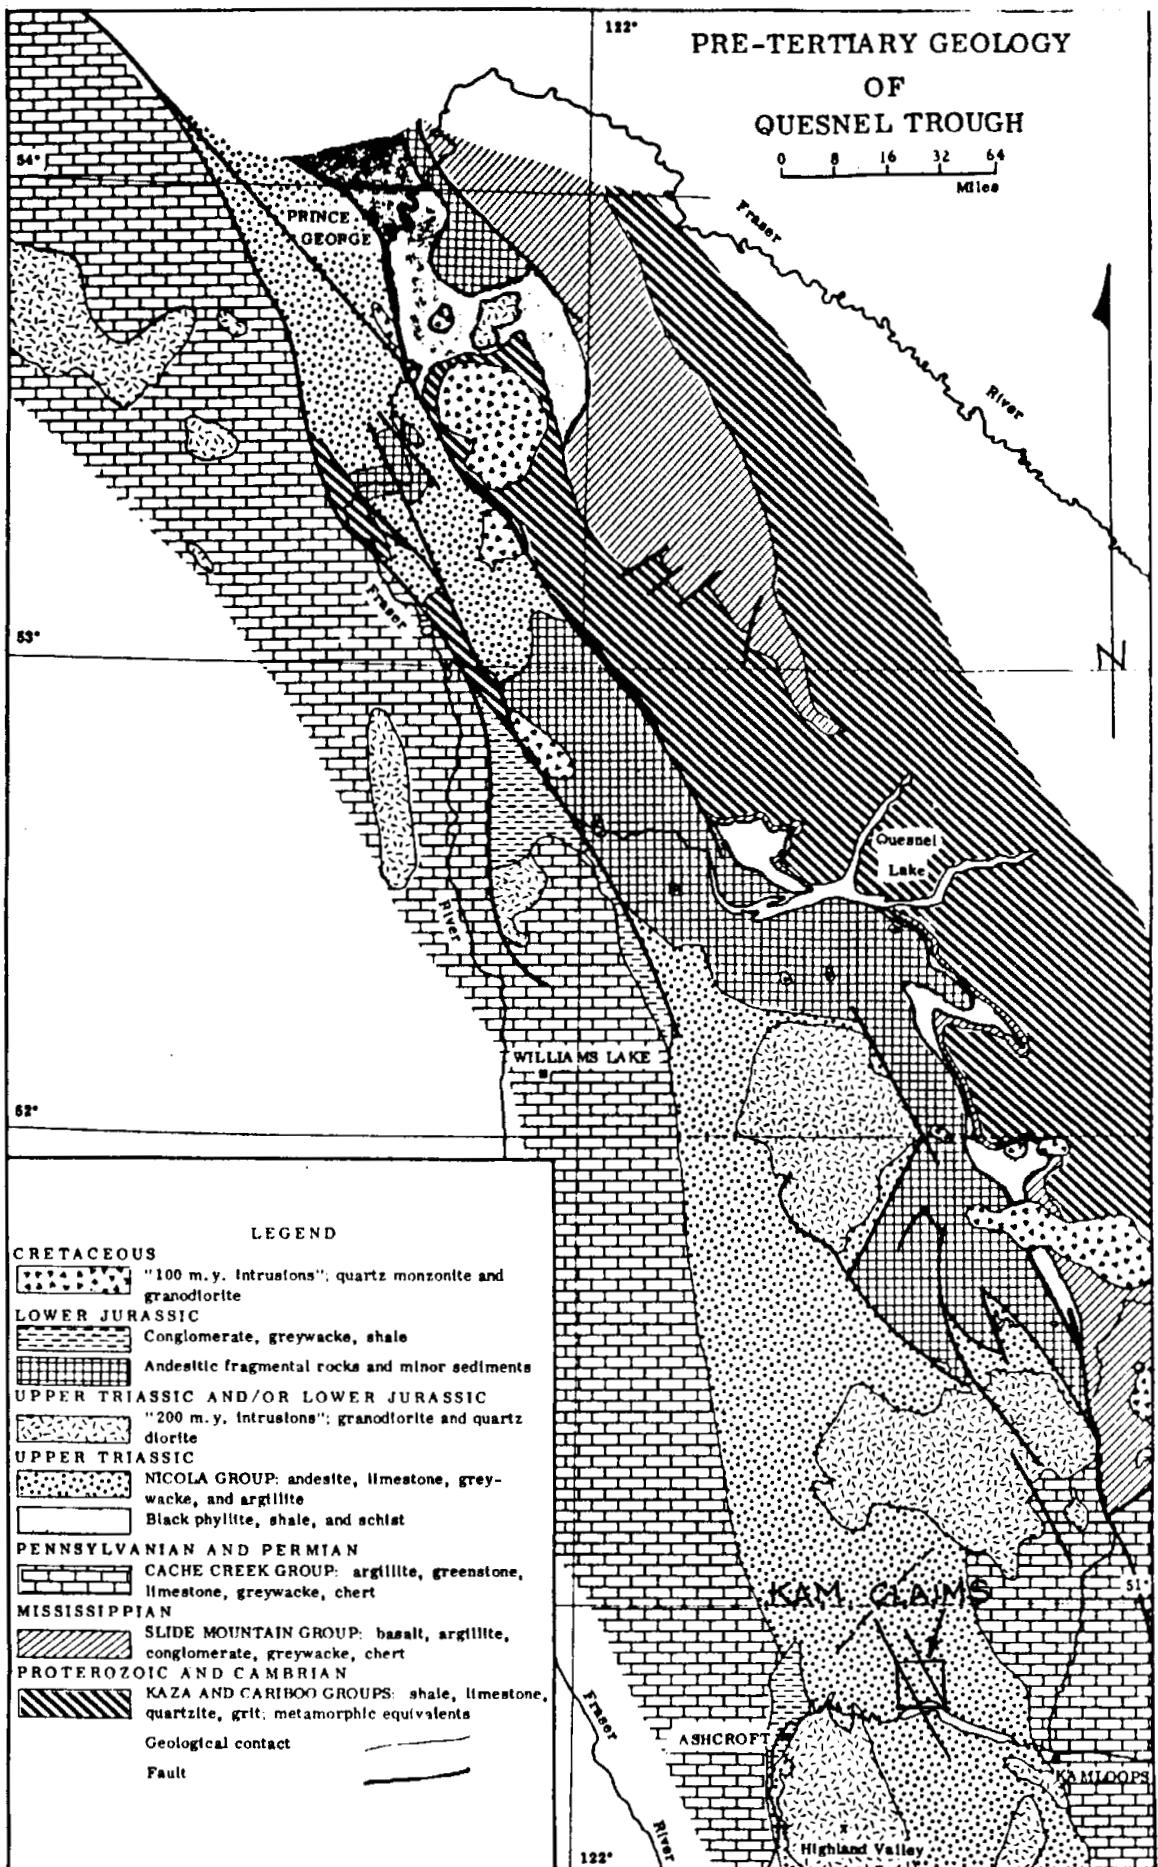

FIGURE 2 — Schematic map of the pre-Tertiary geology of the Quesnel Trough and surroundings. The Trough is defined by the occurrence of Upper Triassic and Lower Jurassic volcanic and sedimentary rocks and is bounded by Paleozoic or older rocks on either side.

FIGURE 4. Regional Geology - Quesnel Trough.

(CIM Bull., July 1970)

from the Kam 23 claim, and gold-silver exploration is presently being aggressively pursued on a number of epithermal prospects situated north of the Kam claims.

Regional geology is shown in Figure 4.

GEOLOGY\_OF\_THE\_KAM\_PROPERTY:

In this brief discussion of geology of the property, much of the information is a summary of previous reports by Debicki, (1985), and Manson, (1984).

The Kam property is underlain mainly by Volcanics and sediments of the Nicola Group, (Late Triassic), although the eastern part of the property is underlain by Ashcroft Formation clastic sediments (Early Jurassic). Small stocks of granite to granodiorite of Jurassic or Cretaceous age intrude the Ashcroft Formation, and small patches of Late Tertiary basalts unconformably overlie the older rocks.

NICOLA\_GROUP:

The Nicola group has been divided into six map units by Debicki as follows:

Unit\_1a: ANDESITE; light to dark green, fine to medium grained, and massive to moderately jointed, locally brecciated.

Unit\_1b: ANDESITE PORPHYRY; greenish to reddish brown, fine grained to aphanitic, Plagioclase phenocrysts occur as tabular laths less than 8 mm in length. Hematite common in matrix.

Unit\_1c: ANDESITE ? LAPILLI TUFF: Green to reddish brown matrix which is medium to coarse grained. Fragments 2 mm to 32 mm. Moderately fractured and locally brecciated.

Unit\_1d: ANDESITE AGGLOMERATE: Similar to 1c, but clasts 32 mm to 20 cm. Possibly derived from Unit 1b.

Unit\_1e: BASALTIC TO ULTRAMAFIC FLOWS: Dark grey to dark green, massive and medium grained. Plagioclase, Hornblende (after Augite), and Olivine phenocrysts. Picrite phases present, these may be serpentinized.

Unit\_1f: ARGILLITE; black to dark brown, fine grained or aphanitic.

ASHCROFT FORMATION: (Unit 2):

The Ashcroft Formation is a multi-colored polymictic conglomerate with lenses of siltstone and sandstone. Clasts are resistant quartzite, chert, or quartz in a sandy matrix. The unit decomposes readily to rubble with loose clasts, often resembling till.

CRETACEOUS (?) INTRUSIONS: (Unit 3):

Granitoid stocks and plugs intrude the Ascroft Formation, north of Sabiston Lake. The intrusive rocks are white to pink, porphyritic to equigranular, and do not appear to have contact alteration phenomena.

STRUCTURE:

The Nicola Group rocks trend northwesterly and have moderate to steep northeast or southwest dips. Small-scale folds are concordant with the regional strikeand dip.

Major northwest-trending faults are common and trend at 332 degrees (slightly oblique to the strike). These are interpreted by Warren as "en echelon" faults related to or extensions of the Pinchi Fault System. The faults follow the major drainages of Deadman Creek, Sabiston Creek and Carabine Creek, and may be normal faults, but offset is unknown. The presence of considerable thickness of Ashcroft clastics on the east side of the property may indicate a "Graben" structure. On a smaller scale, cross faults of limited displacement are likely present.

Tight folding is present in the Ashcroft Formation; there may be an unconformity at the base of the formation.

ALTERATION:

Two common alteration types are:

- 1) : Carbonate-Silica alteration, with buff to yellow weathering carbonate including dolomite, ankerite, and calcite, massive to brecciated, with one or more stages of silica, (chalcedonic), and varying amounts of sericite, kaolinite and pyrite.
- 2) : Argillic alteration; buff to white weathering, may be gossanous. Varies in intensity from pervasive to local alteration of feldspars. Contains weathered pyrite cubes. Confined to one small area on the Jeff Claims. Quartz, dolomite and sericite may be present. Veins of quartz/ilmenite are present.

Several large carbonate-silica alteration zones extend from the shore of Kamloops Lake northward and northwestward, and are believed to occur intermittently along the trend of Sabiston valley throughout the entire claim block, a distance of at least 10 kilometers. Individual alteration zones have been mapped on the south grid, and these are known to be 1500 meters in strike length and up to 150 meters wide. Considerably more mapping will be necessary to outline all alteration zones on the property.

MINERALIZATION:

Mineralization recognized on the property early in its history was disseminated cinnabar in the Silica-carbonate and clay alteration zones. No production has come from the "Independence" vein, about 10 cm wide, exposed in a short adit at the south end of Jeff 1 claim, near the lakeshore west of Copper Creek. The adit has been driven north 40 degrees west on the vein for 18 feet, and thence north for 10 feet to cross-cut the zone, which is about 10 feet wide (Cockfield 1948). The vein is dolomite which contains thin films of cinnabar.

Approximately 1500 feet upstream is another group of workings, where an open cut has been made on a shear zone in the east bank of the dry gulch. Cockfield reports that the zone strikes north 10 degrees east and dips 70 degrees southwest and carries a narrow vein with malachite and azurite stain.

An additional 50 feet upstream on the same gulch, an adit driven 100 feet northeasterly has a 12 foot crosscut 50 feet from the portal and a short crosscut in either direction at the face. Small stringers of dolomite are present, but Cockfield observed no cinnabar at this locality.

Additional showings are thought to exist westerly upslope from Sabiston Lake, where the Rose M claim was staked in 1940. Cinnabar was noted by Cockfield in Volcanics and sediments on the Jane and Plaza claims, (in 1940), on the ridge between Carabine Creek and Sabiston Creek. These showings evidently occurred in rocks of the Ashcroft Formation, and have to be re-discovered by detailed prospecting.

Economic potential of the claims lies not with the mercury mineralization, but with the possibility of additional gold or silver mineralization in epithermal veins or alteration zones.

#### 1987 EXPLORATION PROGRAM:

The geochemical program was started May 20, 1987 and was completed June 4, 1987. A total of 1109. rock geochemical samples and 23 soil samples were taken, some along a network of roads and the balance on small grids centered on baselines 0, 1, 2, and 3, as shown on the accompanying maps. Samples were submitted to

Vangeochem Labs Ltd., North Vancouver, B.C., prior to record date June 10.

Sampling was done by geologists Carol Ditson, B.Sc., and Les Demczuk, and prospector Philip Boldon, Supervised by the writer.

DISCUSSION:

In 1982, reconnaissance stream-sediment and heavy mineral concentrate samples were taken throughout a large area north of Kamloops Lake. Several sample sites contained anomalous mercury and gold. These were clustered in a linear fashion along Sabiston Creek and along the east side of Mt. Uren, and in a smaller cluster 1-2 km north of Sabiston Lake, on the west flank of Eagle Hill. Additional sampling in 1983 and 1984 confirmed these anomalous locations.

In 1983, A line of soil samples in Sabiston Valley, (Line 7000 S), was concentrated by heavy mineral methods (Gold Wheel Concentrator). Nine of sixteen samples treated in this fashion contained from 1,000 to 9,999 ppb. gold, and 2 contained greater than 10,000 ppb gold. Seven of the samples had mercury in excess of 10,000 ppm. Arsenic values were low, (6-26 ppm). In addition, a gold anomaly on Ln 7000S was covered by a small soil-sampling grid, and soil anomalies for gold (20-110 ppb) and mercury (to 4200 ppb) support the heavy mineral results.

Additional work in this area in 1984 involved detailed geological mapping and drilling of a series of 9 percussion drill holes along the access road, near the origin of Grid "3". These holes intersected broad carbonate alteration zones with traces of cinnabar. Penetration into bedrock was limited - 5 to 15 meters.

Maximum values in percussion drilling samples were 11 ppb Au; 0.4 ppm Ag; 133 ppm As; 25 ppm Sb; and 50,000 ppb Hg. No explanation was evident for the heavy mineral concentrate values of 70,400 ppb gold and 380,000 ppb Mercury. Gold particles were noted in the till overburden; evidently the gold has been transported from its origin; detailed studies of the gold morphology by M.W.Milner, consulting geomorphologist revealed that gold is present only in the upper of two layers of till. Two types of gold particles are present: angular particles and worn and flat particles, which may indicate mixing of gold from two separate sources, near and far. Milner feels that the angular gold is from a bedrock source no more than 1-2 kilometers distant and likely from the vicinity of the Nicola/Ashcroft contact, east of Sabiston Creek.

Initial work in 1987 was done along the road network on the north end of the property. A number of strong silica carbonate alteration zones were seen in road cuts, and cinnabar-rich float was seen in a number of localities, (but not in outcrop). Outcrop is relatively scarce in the northern area, except on the northeastern side of the property, where dioritic intrusions have strongly hornfelsed the rock, particularly in the vicinity of the Ashcroft Sediments, making them extremely siliceous, hard and resistant. No alteration accompanies the hornfelsing, and for this reason sampling was limited in this area.

On the west side of the Sabiston Valley, from the main access road northward, carbonatization is common, probably related to the

Grid\_Baseline\_1 extends southward from an old access road, to the west of Grid "O" , along a similar area of rusty soil and previously mapped carbonate alteration.

Grid\_Baseline\_2 is a short line along a steep gully south of the Copper Creek road and above the Lake, east of Grid "O". A small coloration anomaly in rock exists here, but no mineralization was seen.

Grid\_Baseline\_3 extends northward from the Copper Creek road through a relatively flat area of sage and scattered pines, under which gold was found in till by Canico geologists. Soil lines at 50 meter intervals and samples at 25 meter intervals test the zone.

#### **RESULTS:**

The only elements plotted on the accompanying grid and traverse maps are Arsenic (As), Antimony (Sb), Copper (Cu), Silver, (Ag), and Gold (Au) and Mercury (Hg). The following levels are used as an arbitrary guide to determining anomalous levels:

## GEOCHEMICAL PARAMETERS

ELEMENT	As	Sb	Cu	Ag	Au	Hg
Detect. Limit	3 ppm	2 ppm	1 ppm	0.1 ppm	5 ppb	5 ppb
Background	0-5 ppm	0-4 ppm	25 ppm	0.1 ppm	5-10	<200
Anomalous	10 ppm	> 5 ppm	>60 ppm	>0.4 ppm	20	>500
Very Anomalous	> 20 ppm	>20 ppm	>200 ppm	>1.0 ppm	50	>1000

Other elements which may be useful as pathfinders are Bismuth (Bi), Manganese (Mn), Barium (Ba), Strontium (Sr), Calcium (Ca), Iron (Fe), Cobalt (Co) and Nickel (Ni).

For comparison, rock geochemical results from Canico reports (1982-1986) are shown below:

TABLE II  
1982-86 ROCK GEOCHEMICAL SAMPLES  
KAM/JEFF CLAIMS - KAMLOOPS M.D.

Soil sampling along the road systems in the north part of the property indicate large areas of moderately anomalous copper (100-200 ppm), with smaller areas where silver is weakly anomalous. These areas do not coincide. Weak arsenic and antimony anomalies are, however coincident. The copper anomalies coincide with carbonatized ultramafics or volcanics. In the road traverses it is apparent that all anomalous areas are clustered along the west side of the Sabiston Creek Fault.

Four geochemical grids all have large diffuse soil anomalies with moderate to high mercury. The anomalies coincide with silica carbonate altered serpentinized ultramafics along northwest fault zones. Copper anomalies of lesser extent and magnitude have scattered weakly to moderately anomalous arsenic. Gold values on the grids vary from 0 to 30 ppb. Values from 20 -30 ppb are considered weakly anomalous.

The best anomalies are considered those on Grid "1" and Grid "3". The anomaly on Grid "2" is smaller, and the anomaly on Grid "0" is diffused and no strong target areas are defined. Considering the style of mineralization seen, copper and mercury appear to be the most definitive elements.

The area of Grid "3" overlies an area in which gold was found in the till. Anomalous mercury in soils over a wide area here suggests a broad alteration zone at depth, with carbonatized serpentinites. This could be the source of the particulate gold.

Additional soil sampling at greater depths in the profile may help to define mineralized areas. Percussion drilling within the main anomalies is recommended, with diamond drilling to follow, if results warrant.

Geology and geochemical anomalies should be compiled, and on this basis, sites for prospecting, further sampling, and percussion drill-holes may be chosen.

RECOMMENDATIONS:

Percussion drilling of major anomalies, using angle holes (45 to 60 degrees) up to 250 feet deep is recommended for targets with corresponding mercury +/- arsenic +/- antimony +/- gold targets.

Diamond drilling should be done only to test depth potential of those zones which show potential from surface exploration and percussion drilling.

A suggested exploration budget for the second and third phases of exploration of the property is presented on the following page.

respectfully submitted

Barry J. Price

Barry J. Price, M.Sc.

Consulting Geologist.

AUGUST 23, 1987.

SUGGESTED EXPLORATION BUDGET:PHASE II.

Percussion drilling, 2000 ft @ \$16/ft	\$32,000.00
Geochemical analyses, 200 x \$15.00	3,000.00
Geological supervision, 10 days @ \$250	2,500.00
Meals and Accommodation 30 man days X \$70	2,100.00
Vehicle Rental	1,500.00
Expendable Field Supplies	500.00
Mobilization	2,000.00
Report preparation, Drafting, etc.	2,500.00
Contingency	4,000.00
	=====
TOTAL	\$50,100.00

PHASE III

Diamond Drilling 2000 ft @ \$30/ft all incl.	60,000.00
Geological Supervision, Reports etc	10,000.00
Support, accommodation, meals etc	10,000.00
	=====
TOTAL	\$80,000.00

RESPECTFULLY SUBMITTED

CERTIFICATE

I, Barry J.Price, with business address at 3447 W. 7th Avenue, Vancouver, B.C. do hereby certify that:

- 1) I am a Consulting Geologist registered with the Geological Association of Canada as a Fellow and I am entitled to use their seal, which has been affixed to this report. I am a member of the Canadian Institute of Mining, the Society of Exploration Geologists, and several other professional organizations.
- 2) I hold a B.Sc. (Honors) Degree in Geology (1965) and a M.Sc. in Geology (1972), both from the University of British Columbia., Vancouver, B.C.
- 3) I have practised my profession as a geologist continuously since 1965, having worked in Canada, The United States of America, Mexico, and the Republic of the Phillipines, for a number of large and small companies and consulting firms, including Manex Mining Ltd., J.R.Woodcock and Associates, Archer Cathro and Associates and P.A.Christopher and Associates.
- 4) I have based this report on available geological data on the property and adjacent properties and mineral deposits, and on my personal knowledge of the area, accumulated since 1974, and personally worked on the subject property, and supervised Geologists C.I.Ditson, B.Sc., and Les Demczuk, (M.Sc.Equiv), and sampler P.Boldon, who worked on the property.
- 5) I have no interest in the claims described in the report nor in the securities of Emerald Star Mining Explorations Ltd., and will receive only normal consulting fees for the preparation of this report.
- 6) I do not have any interest in any mineral claims within 25 km. of the Kam and Jeff claims.
- 7) I consent to the use of this report by Emerald Star Mining Explorations Ltd., for whatever purposes they deem necessary.

Barry James Price, M.Sc.  
Consulting Geologist.  
Aug 23, 1987.

## APPENDIX I

### GEOCHEMICAL PROCEDURES AND ANALYTICAL METHODS

Rock samples were chips of 2-5 cm size filling a kraft gusseted soil sample envelope, or small plastic bags of about 1 kg capacity. These were taken when quartz veining or noticeable alteration or mineralization were present.

Soil samples were of sub-organic layer; "B" horizon where possible, but often of till in the project area. Approximately 0.2 to 0.5 kg were dug and placed with a stainless steel scoop into gusseted kraft soil sample bags.

Samples were shipped by Greyhound Bus Lines to Vancouver, and were analyzed by ICP (induction coupled plasma) methods by Vangeochem Labs., North Vancouver. Analytical procedures are noted on the geochemical result tabulations in the appendix.

## VANGEOCHEM LTD. LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N. VANCOUVER B.C. V7P 2S3 PH: (604) 986-5211 TELEX: 04-352578  
 BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V8L 1L6 PH: (604) 251-5656

## ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.  
 THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.  
 IS= INSUFFICIENT SAMPLE. ND= NOT DETECTED. -- NOT ANALYZED

COMPANY: RAPITAN RESOURCES  
 ATTENTION:

## VANGEOCHEM L B LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N. VANCOUVER B.C. V7P 2S3 PH: (604) 986-5211 TELEX: 04-352578  
 BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH: (604) 251-5656

## ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.  
 THIS LEACH IS PARTIAL FOR SN,MN,FE,CAP,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.  
 IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, - = NOT ANALYZED
