SUMMARY

Reconnaissance geochemical surveys were carried out over two areas on the Wren (Thrush) group from June 20 to July 7, 1987 by a three man crew and from September 1 to 12, 1987 by a two man crew.

The geological setting consists of northerly striking, moderately dipping, mainly volcanic rocks with lesser sedimentary rocks and mafic to ultramafic intrusions of the Devonian-Permian age Fennel Formation in contact with granitic intrusive rocks of the Cretaceous age Baldy Batholith. Easterly striking fault and shear structures, frequently mineralized, cut the Fennel rocks in the area.

The geochemical surveys comprised collecting 500 samples in the early phase of the program and 200 samples in the later phase. On the north grid (Wren 4 and 5 claims) all samples were analyzed for copper, lead, zinc, silver, and arsenic, resulting in the indication of a long, lineal copper anomaly. On the south grid (Wren 2 claim) a geologically promising, topographic saddle is host to anomalous, but erratically distributed, copper, arsenic, and gold soil samples.

Further exploration is warranted. The saddle area on Wren No. 2 claim is the most geologically and geochemically attractive. It requires a geophysical survey and more detailed geochemical soil surveys. The copper anomaly on Wren No. 4 and No. 5 claims, although of some interest, should be viewed as a lower priority target.

INTRODUCTION

A reconnaissance geochemical survey was carried out by Orcan Mineral Associates Ltd., on behalf of Big Ben Resources, on the Wren property situated east of Dunn Lake, B.C. (NTS 92P/8E). This preliminary survey was undertaken during two periods: by a three man crew from June 20 to July 7, 1987 and by a two man crew from September 1 to 12th, 1987. The program was under the direction of the writer.

Stratabound, volcanogenic, massive sulphide, polymetallic mineral deposits, which would generally strike northerly and dip steeply west were the primary targets sought. Precious metal-bearing fissure-vein deposits, which would strike east-west and dip steeply parallel to the mineralized structures on the adjoining Windpass and Gold Hill properties, were important secondary targets.

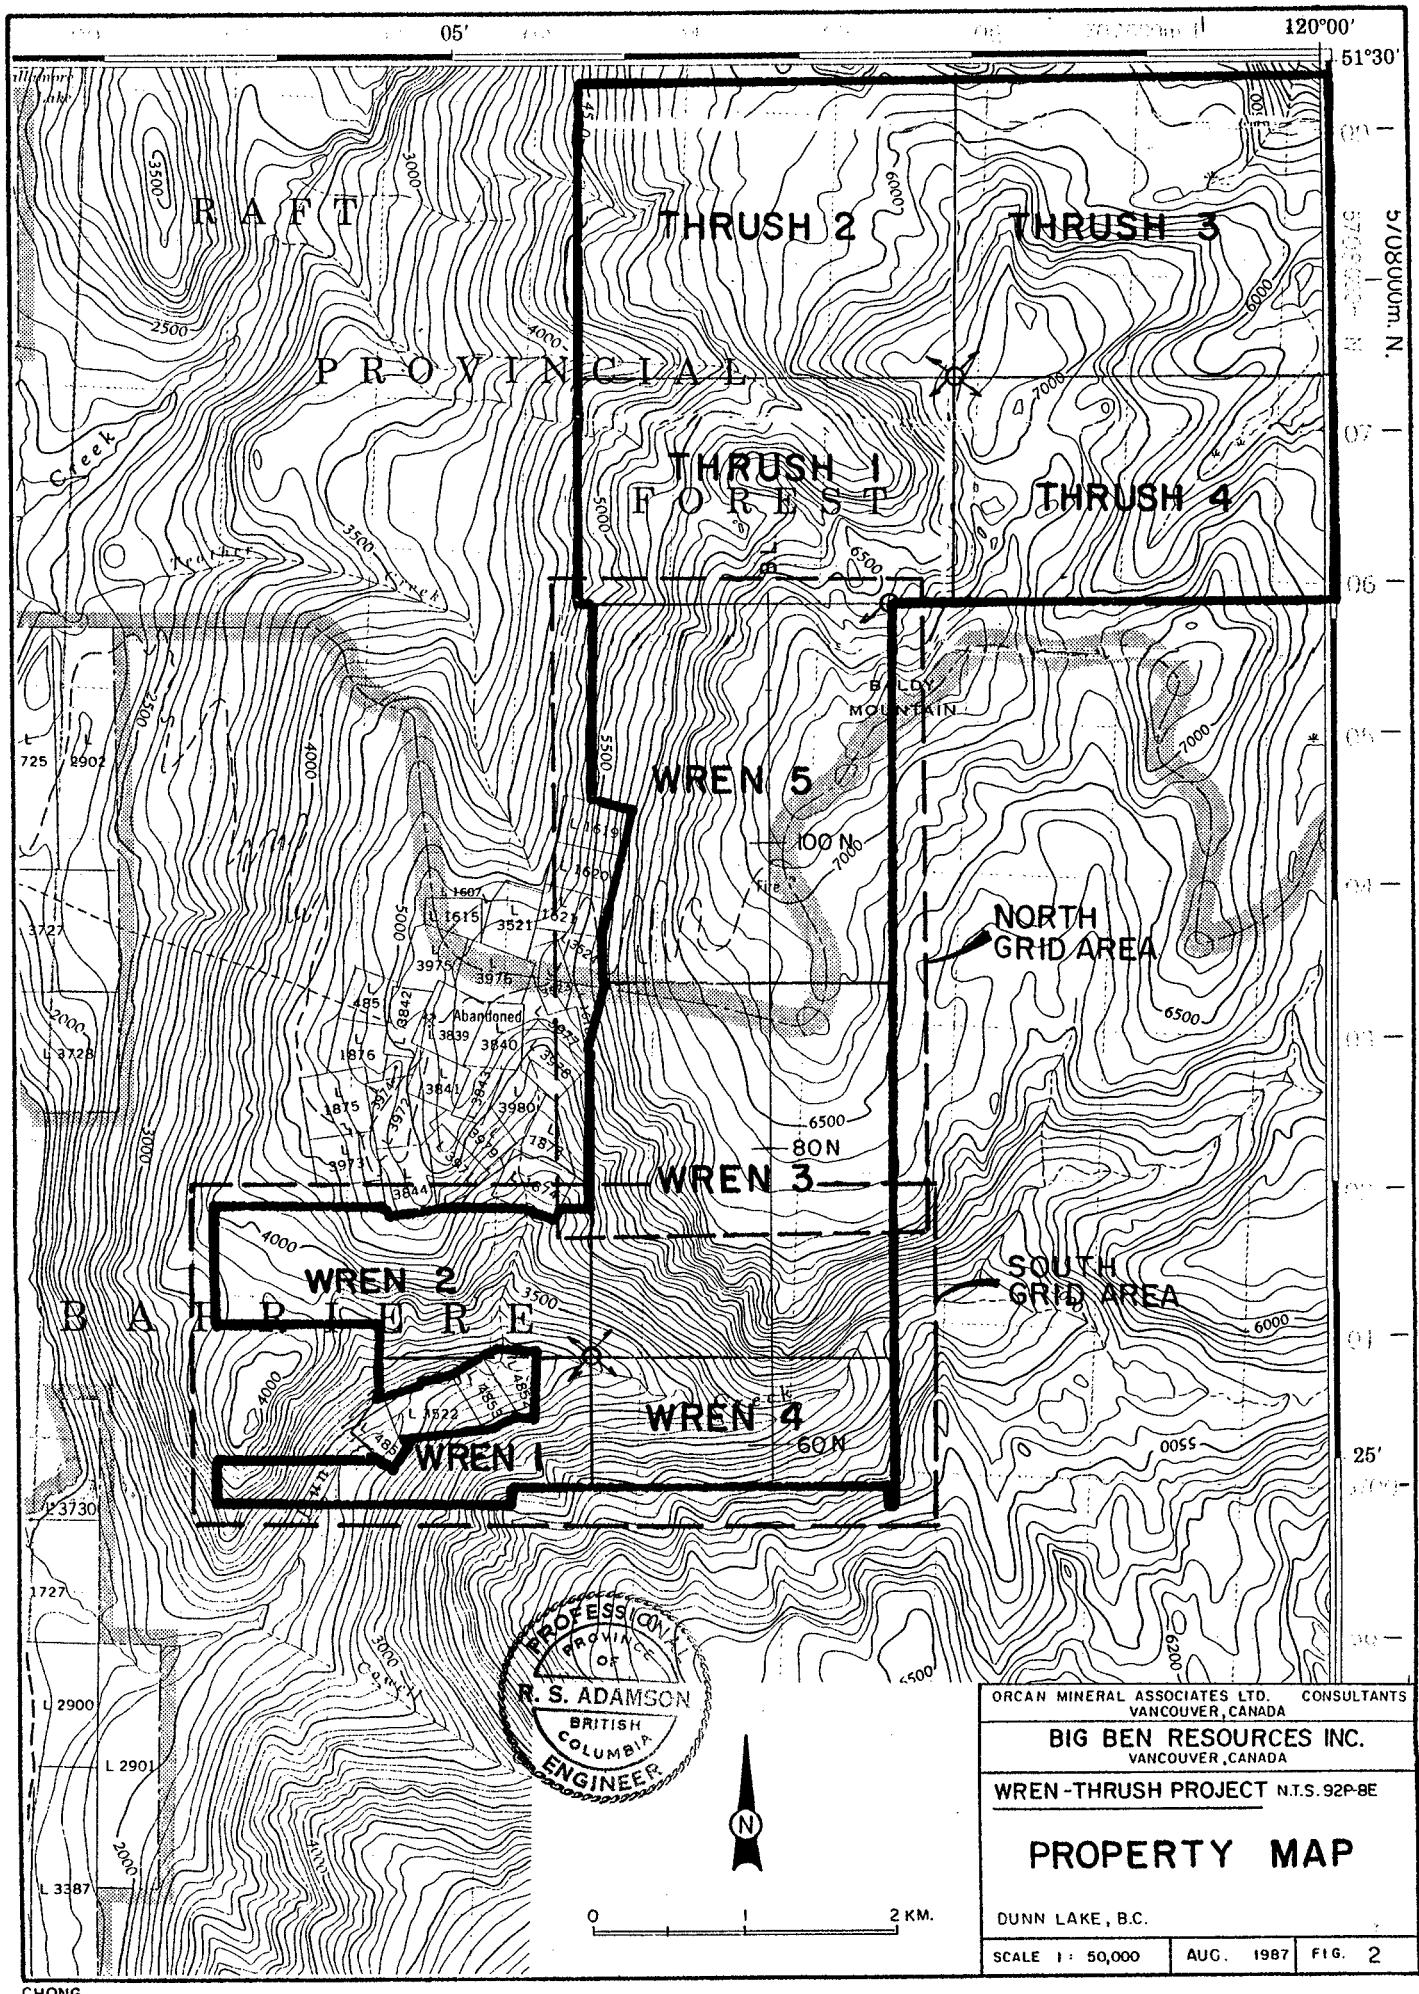

Location and Access (51°27-1/2'N Latitude; 120°05'W Longitude)

The property lies east of Dunn Lake, partially astride Dunn Creek. Kamloops, located approximately 90 kilometres due south, is the nearest major centre of communication and supply (Figure 1).

Access to the north part of the property is by a rough gravel road from Dunn Lake uphill through the Windpass property to a fire lookout station on the property (Figure 2). To reach the south half of the property, another rough gravel road, that extends part way up Dunn Creek, is available. Dunn Lake is reached from the village of Chu Chua on Highway 5, along a good gravel road situated on the east side of the North Thompson River.

Property

The property comprises five located Wren mineral claims and four located Thrush mineral claims (Figure 2). The geochemical surveys covered only the Wren claims. They are enumerated as follows:

| <u>Claim</u> | <u>Units</u> | <u>Record No.</u> | <u>Recording Date</u> |
|--------------|--------------|-------------------|-----------------------|
| Wren No. 1 | 10 | 6728 | August 8, 1986 |
| Wren No. 2 | 10 | 6730 | August 8, 1986 |
| Wren No. 3 | 20 | 6731 | August 8, 1986 |
| Wren No. 4 | 8 | 6729 | August 8, 1986 |
| Wren No. 5 | 20 | 6732 | August 8, 1986 |

Below timberline at approximately 1,800 metres (6,000 feet), the property is thickly wooded with second growth timber. Grass, heather, and local stunted trees are present above timberline (mainly on Wren 4 and 5 claims). Relatively precipitous terrain occurs in Dunn Creek valley.

History

Most of the area covered by the Wren claims was held by Barrier Reef Resources, who staked the MS claims in 1978, soon after the discovery of the Chu Chua massive sulphide deposit located four kilometres south of Dunn Creek.

In 1979, Barrier Reef optioned the property to Canadian Nickel Company who that year carried out extensive geophysical surveys (magnetometer and electro-magnetometer). In 1980 as part of that program, the company drilled 377.6 metres of core holes on a large conductor that lies off the Wren property. As the program was unsuccessful, the option was terminated in 1980.

In 1983, Barrier Reef carried out reconnaissance geological mapping and a soil geochemical survey on the property. Samples were analyzed for gold, silver, and copper. Results for the most part were insignificant, although a few, erratically distributed, anomalous gold values reported from soils flanking Dunn Creek could be of interest.

The MS claims were subsequently allowed to lapse. The Wren (and Thrush) claims were staked in August, 1986.

Personnel

The crew in the field during the June-July phase of the program comprised the following:

Mr. W.D. Harris, B.Sc. - geologist and supervisor
Mr. A. Graham - prospector and soil sampler
Mr. B.M Harris - prospector and soil sampler

During the September phase, the above crew did not include Mr. Graham.

Both phases of the program were directed by the writer.

GEOLOGICAL SETTING

The Dunn Lake area is underlain by volcanic and sedimentary rocks of the Fennell Formation, which ranges in age from Devonian to Permian. This formation, in contact on the east with Cretaceous age granitic rocks of the Baldy Batholith, comprises meta-basalt and chert with lesser amounts of argillite, quartzite, and limestone or marble. Intrusive rocks in the formation, probably the feeders for the volcanic rocks, consist of gabbro, diorite, and diabase.

These units have been folded, and possibly thrust faulted, along northerly striking axes; attitudes are moderately dipping to the west for the most part. Faults and shear structures (sometimes mineralized) strike predominantly east-west and dip moderately to steeply north.

The most common rock type on the property is a fine grained, dark green, massive greenstone of the Fennell Formation. A gabbroic sill or dyke, which intrudes Fennell rocks, lies on the Wren 4 and 5 claims between the Windpass crown grants and the Baldy Batholith. This body exhibits a very strong aeromagnetic signature.

GEOCHEMICAL SAMPLING

Five hundred samples (481 soil, 12 silt, 7 rock) were collected during the first phase by the three man crew. In the second phase, a further 200 samples (197 soil, 3 rock) were collected.

Sampling Techniques

Two grids (north and south) were established on the property. The north grid covered much of the Wren 3 and 5 mineral claims; the south grid covered most of the Wren 2 claim (Figure 2).

On the north grid, flagged crosslines were laid out perpendicularly at 200 metre intervals along the baseline established with compass on tripod and chain. Sample stations along the crosslines and the baseline were at 50 metre spacing (Figures 3-7).

On the south grid, flagged crosslines were laid out at 100 metre intervals on Wren No. 2 claim, perpendicular to one of two reconnaissance soil lines; each of which was earlier established with compass and topofil. Sample stations along the crosslines

were at 25 metre spacing. Along the east-west lines, spacing varied from 25 to 50 metres (Figures 8-13). The south grid, excluding the east-west lines, was sampled in September.

from the B horizon

Soil samples were collected with the aid of a short mattock. Each sample was placed in a high-wet-strength kraft paper bag, then shipped to Chemex Labs in North Vancouver for analyses.

Analytical Procedures

All soil and silt samples were initially dried at 60°C, sieved to -80 mesh, then split.

The first phase samples (June and July) were analyzed as follows:

Subsamples (0.5 gram) were digested in hot dilute aqua regia in a boiling water bath and diluted to 10 ml with demineralized water. The solution was analyzed for silver, copper, lead, and zinc by atomic absorption techniques and analyzed for arsenic by the graphite furnace atomic absorption method. The silt samples were analyzed for gold using the fire assay and atomic absorption technique.

The soil samples collected in September were put into solution in the same manner as the initial samples, but were then analyzed for 30 elements using the inductively coupled argon plasma (ICP) method. Rock samples were analyzed the same way after they were initially pulverized to -100 mesh.

GEOCHEMICAL RESULTS

The geochemical values are compiled in the appendix and displayed on Figures 3 to 7 (north grid) and 8 to 12 (south grid). Because of the relatively wide spacing

between sample lines and because of the generally erratic distribution of anomalous values, the results were not contoured for the most part.

On the north grid, anomalous values in lead, zinc, silver, and arsenic are few, and essentially isolated from one another. Only anomalous copper values (Figure 5) exhibit some concentration. A north-northeasterly striking, lineal geochemical zone, approximately 1,400 metres in length, is indicated. It appears to be partially associated with a gabbro intrusion which occurs in close proximity to the anomaly.

On the south grid, anomalous lead and silver values do not occur. A few anomalous zinc values occur locally, essentially east of the grid area. Anomalous copper, arsenic, and gold values are present, but are not strongly anomalous. There is no obvious direct correlation evident between these metals. Nonetheless, anomalous values (copper, arsenic, gold) could indicate vein type gold occurrences crossing the grid area.

CONCLUSIONS

On the basis of the reconnaissance geochemical evidence revealed to date on the Wren property, two styles of mineral occurrences are suggested. On the north grid (Wren 4 and 5), disseminated copper is indicated, possibly associated with a diorite intrusion. On the south grid (Wren 2), fissure vein type gold mineralization associated with copper and arsenic is indicated.

The south grid area on Wren 2 claim lies over a prominent saddle that trends east-west. The saddle may topographically reflect the presence of one or more shear or fault zones. The Windpass and Sweethome gold occurrences to the north of the saddle, and the Gold Hill gold occurrences to the south are all associated with easterly striking fracture systems. In view of this implied favourable geological setting and because anomalous copper, gold, and arsenic values, albeit erratically distributed for the most part, occur in soils overlying the saddle, further exploration is warranted and should be undertaken.

Recommendations

A geophysical survey should be carried out over the saddle area. It should consist of a VLF electromagnetic survey, supported by a magnetometer survey, with a view to identifying easterly striking structures. Once identified, detailed fill-in geochemical sampling should be undertaken.

The copper anomaly on Wren 4 and 5 claims should be prospected in detail and some detailed fill-in geochemical soil sampling should be carried out concurrently. Samples should be analyzed for copper, arsenic, and gold.

Respectfully submitted by,
ORCAN MINERAL ASSOCIATES LTD.

Robert S. Adamson, P.Eng.

CERTIFICATE

I, Robert S. Adamson, with business and residential addresses in Vancouver, British Columbia, do hereby certify that:

1. I am a consulting geological engineer.
2. I am a graduate of the University of British Columbia, (B.A. Sc. in Geological Engineering, 1957).
3. I am a registered Professional Engineer of the Province of British Columbia.
4. From 1957 until 1967, I was engaged in mineral exploration in Canada for a number of companies. Positions included Senior Geologist, Chief Geologist, and Vice-President, Exploration. Since 1967 I have been practising as a consulting geological engineer and, in this capacity, have examined and reported on numerous mineral properties in Africa, Europe, and North and South America.
5. I examined the Wren-Thrush property on June 8, 1987.
6. I have not received, directly or indirectly, nor do I expect to receive any interest, direct or indirect, in the property of Big Ben Resources Inc. or any affiliate thereof, nor do I beneficially own, directly or indirectly, any securities of Big Ben Resources Inc. or any affiliate thereof.

Vancouver, Canada

Respectfully submitted,

A handwritten signature in black ink, appearing to read "R. S. Adamson".
