STANDARD CREEK PROPERTY
Geological, Geophysical and Geochemical Report
Lillooet Mining Division
NTS 92 J 10

SUMMARY

Armeno Resources Inc. and Trans Atlantic Resources Inc. hold a total of 171 mineral claims (Standard Creek Property) along the southern boundary of the Bridge River Gold Camp. The property lies along the southeast extension of a major gold bearing structure, the Cadwallader Break (Bralorne Fault system). This fault system hosts the Bralorne/Pioneer mining complex, 13 kilometres to the northwest. Before the Bralorne/Pioneer operation was closed in 1971 it was the largest gold mine in B.C., having produced 7.2 million tonnes grading 18 grams gold per ton.

During July and August 1987, Armeno Resources Inc. funded a programme of geological mapping, geochemical rock and soil sampling and geophysical surveys. The work, which follows earlier investigations on the property, was concentrated in five areas: the Standard, Chopper, Royal, Upper Piebiter and Red Hawk zones.

Results of this programme have identified several areas on the property with indications of gold-silver mineralization. Additional work, including diamond drilling and underground exploration, is recommended for the property.

1.0 INTRODUCTION

The Standard Creek Property covers a major gold-silver prospect southeast of Bralorne, B.C. From July 3 to August 1, 1987, field work entailing geological mapping, geophysical surveys and geochemical rock and soil sampling was carried out over the property.

Field work was contracted out to Azimuth Geological. The programme was carried out by a five person crew under the direction of Thomas Carpenter. Results of the programme are discussed in the following report.

1.1 Location and Access

The property is located in the Lillooet Mining District, B.C., approximately 13 kilometres southeast of Bralorne, B.C. The claims cover approximately 25.5 km^2, centering on latitude 50°42'N and longitude 122°37'W.

Access to the property is by 20 kilometres of gravel logging road exiting southeast from Gold Bridge, B.C. Approximately 110 kilometres of good gravel road connect Gold Bridge with Transprovincial Highway 12 at Lillooet, B.C.

1.2 Property and Claim Status

The Standard Creek property currently consists of 171 claims and claim units identified in Table A. The accompanying maps on pages 3 and 4 show the relative location of these claims.

1.3 History and Previous Work

The Standard Creek Property is a recent consolidation of several gold and silver bearing prospects located near the confluence of Standard Creek with Cadwallader Creek.

Interest in the Cadwallader Creek area dates back to 1897 when lode gold was first discovered. Work on the Standard Creek Property is first reported in the early 1930's and is briefly summarized below.

1. During 1932 Standard Gold Mines Ltd. explored the Standard Prospect with several open cuts, trenching and two adits. The largest adit (Standard Adit) 204 metres in length, is reported to have contained a 21 metre gold bearing zone averaging 4.3 grams/tonne (0.125 oz./ton) with gold values up to 5.8 grams/tonne (0.17 oz./ton).

2. Red Hawk Gold Mines Ltd. worked the Red Hawk Property in 1932 and 1933. Several surface cuts and short underground workings were used to test quartz veins carrying gold values.

3. In 1932 Cadwallader Gold Mines carried out ground sluicing and underground development on the Royal Prospect. A short crosscut adit was driven across quartz veins up to 1.37 metres (4.5 feet) wide.

4. During 1933 Butte-I.X.L. Gold Mines Ltd. explored the Butte-I.X.L. claims east of the Red Hawk Property. A small shaft and adit were used to test quartz exposures.

5. In 1948 a tungsten-copper showing (Chalco/Lower Piebiter) was discovered above the northwest side of Piebiter Creek, two kilometres north of the Royal Prospect. The showing was drill tested in 1969 and again in 1979-80. Drilling confirmed the presence of low grade tungsten-copper mineralization.

6. In 1980 Chopper Mines (Dragon Resources Ltd.) located the Pat and Tom claims along the northeastern boundary of the property to cover a prominent three metre wide Ag bearing quartz vein (Chopper Vein). The vein has been traced over 2,400 metres in length with reported silver values of up to 1,585 grams/tonne (46.36 oz./ton) in selected grab samples. The Pat and Tom claims along with the adjoining Mac and June claims were subsequently purchased by Armeno Resources Inc. in 1986.

7. During the period from 1980 - 1982 Hillside Energy Corp. carried out a soil geochemical sampling programme near the Royal Prospect and on the west side of Cadwallader Creek (Butte-I.X.L.). Results of sampling by Hillside on the Royal and Standard Groups identified several areas of interest. No further work was carried out at the time.

8. In 1985 Hudson Bay Exploration and Development Co. Ltd. conducted geological mapping and geochemical sampling on the Butte-X-Cal prospect, identifying a number of gold geochemical anomalies. The Butte-X-Cal claims were subsequently purchased by Armeno Resources Inc. in August 1986.

9. During 1985 and 1986 Armeno Resources Inc. and Trans Atlantic Resources Inc. commenced an extensive exploration programme comprising geochemical, geological and geophysical surveys and diamond drilling. The programme identified seven areas of interest. Exploration was continued in 1987 based on the results and recommendations of this major programme.

1.4 Work By Armeno Resources Inc. In 1987

Field work by Armeno Resources Inc. commenced on July 3, 1987 and continued until August 1, 1987. The focus of the 1987 work was to define potential mineralized zones within seven areas of interest (Standard, Royal, Chalco/Lower Piebiter, Upper Piebiter, Butte-I.X.L., Butte-X-Cal, Chopper) identified by earlier exploration programmes.

Exploration efforts were concentrated on five of the seven areas. Grids were established on the Standard, Chopper, Royal, Upper Piebiter and Red Hawk (west of Butte-I.X.L.) zones and are shown on Dwgs. L 1001 to L 1003. A systematic approach of (1) detailed geological mapping, (2) detailed VLF/EM and magnetic surveys, and (3) rock and soil geochemical sampling were carried out over the zones. Careful consideration was given to identifying possible structural controls for potential gold-silver mineralization.

Approximately 27 kilometres of survey grid were completed on the zones and a total of 534 soil and 155 rock samples were collected. Results of the 1987 surveys are discussed later in the report (Section 5.0).

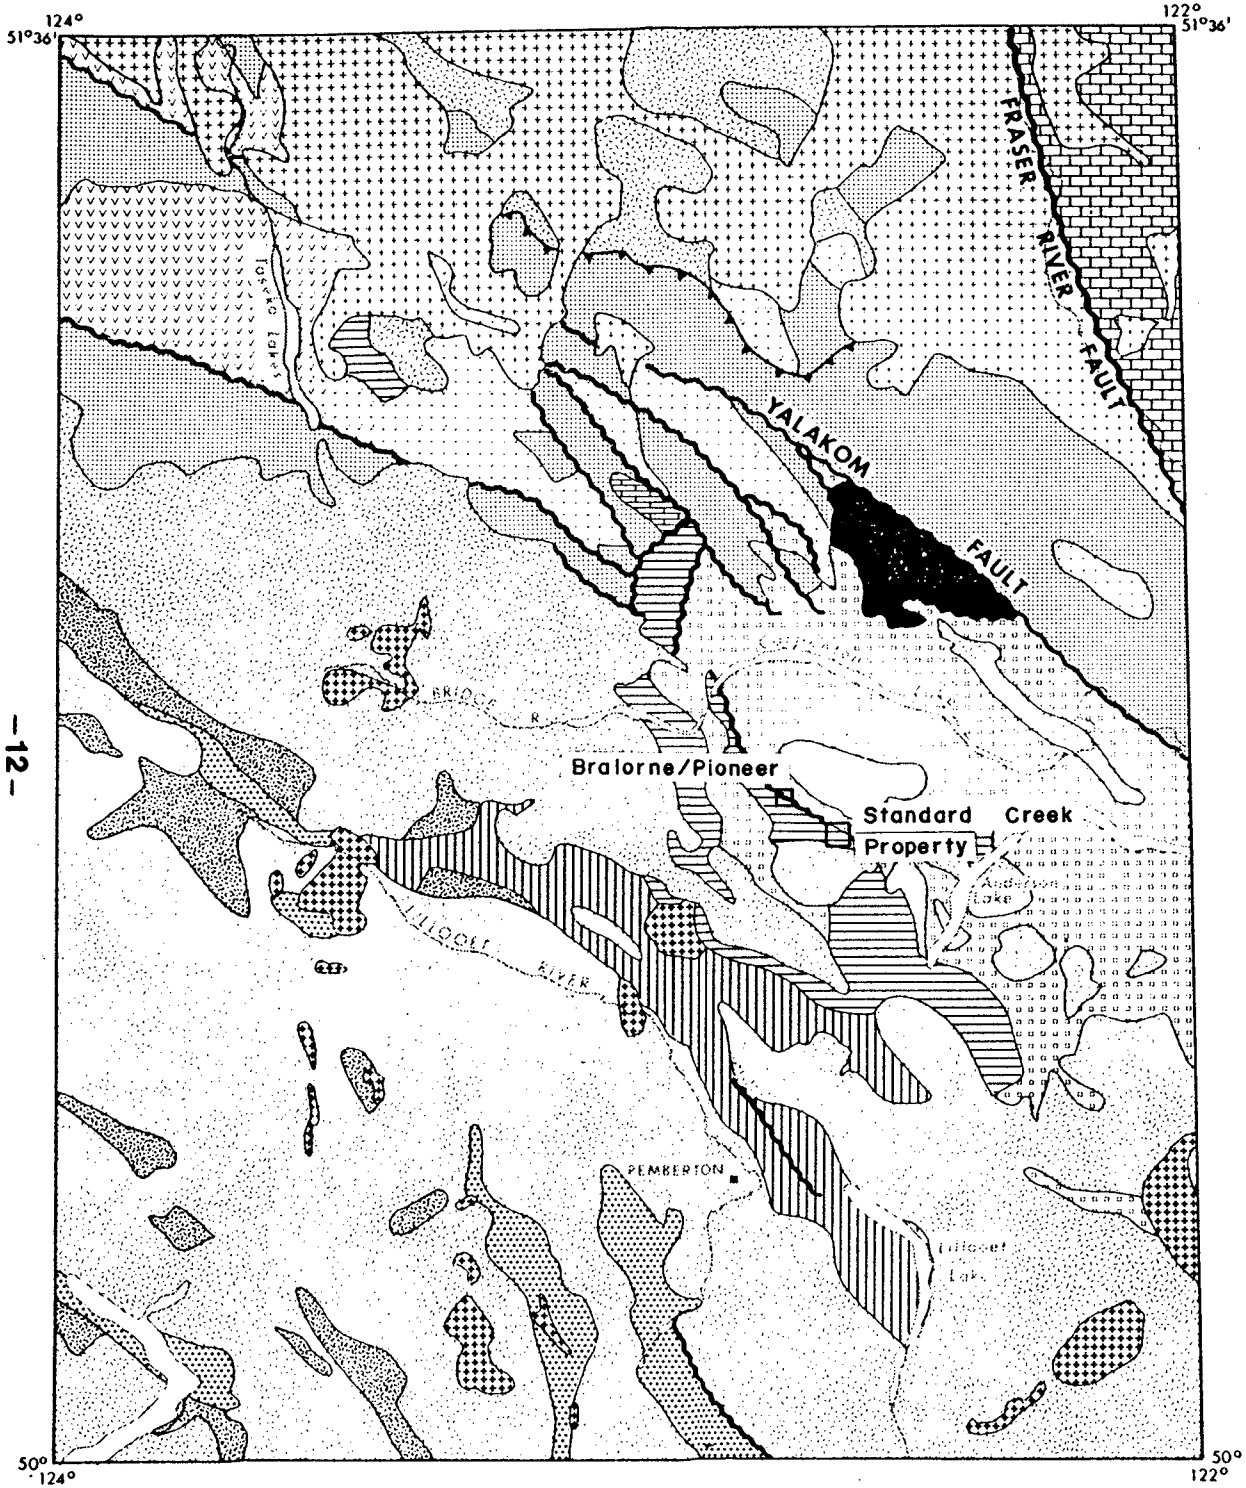
2.0 GEOLOGY AND MINERALIZATION

2.1 Regional Geology

The geology and mineralization of the Bridge River - Cadwallader Creek area is well documented in the literature and remains the subject of investigations. The reader is referred to publications by McCann (1922), Cairnes (1937), Joubin (1948), Roddick and Hutchinson (1973), Pearson (1975), Woodsworth and Roddick (1977), Woodsworth et al (1977), Bellamy and Saleken (1983) and Church (1986a) for a complete understanding of the geology and mineralization. The accompanying map (after Woodsworth, 1977) on page 12 illustrates the general geological setting surrounding the Standard Creek Property.

The property is underlain by a series of fault bounded strata of Triassic Cadwallader Group argillites, greenstones, limestones, metamorphosed sediments and volcanics and Paleozoic Fergusson Group (Bridge River Complex) argillites, cherts, basalts and phyllites.

These units have been intruded by Cretaceous Bendor quartz diorite, Jura-Cretaceous President ultrabasics and Bralorne diorites.



LEGEND

TERTIARY

- Basalt, andesite, dacite
- GARIBALDI GROUP and related rocks: andesite, basalt, dacite

0 km 30

after Roddick and Woodsworth (1975)
in Economic Geology Volume 72 p. 172-173

2.2 Local Geology

Mapping of the local geology was carried out at a scale of 1:5,000 by pace and compass traverse using a photomosaic base map for control. Mapping in greater detail was carried out at a scale of 1:2,500 using geochemical and geophysical grids for control. Results of the grid mapping are presented on separate drawings (G-1000 to G1004) included with the discussion of results.

Ten rock units have been identified during the mapping of the Standard Creek Property and are described below. Detailed description of rock samples are given in Table B (Rock Sample Descriptions).

Oldest (?)

(1)	**Argillite**	Black, massive to fissile, interbedded with dark grey chert.
(2)	**Quartzite**	Light grey weathering. Thin section descriptions indicate a possible felsic volcanic origin.
(3)	**Quartz Biotite Schist**	Often intimately associated with quartzite, biotite content to about 30%.
(4)	**Limestone**	Found as lense like masses, commonly recrystallized.
(5)	**Volcanics**	Massive greenstone, usually containing epidote-garnet veins with minor quartz. Volcanic sediments, ie. agglomerate and tuffs. "Agglomerates" composed of stretched quartz pebbles in biotite matrix. Metavolcanics comprising fine grained biotite schists and phyllites. The latter possibly of intermediate to felsic composition.
(6)	**"Spotted Schist"**	Composed of euhedral to rounded feldspar pheocrysts in a variably foliated fine grained matrix. Biotite along foliations.
(7)	**Ultramafics**	Undifferentiated. Vary from dunite to pyroxenite in composition. Largely serpentinized.

(8)	**Talc Altered Ultramafics**	Composed of masses of ultramafic material which has been completely altered to talc.
(9)	**Listwanite**	Alteration end product of ultramafics. Consist of talc, carbonate, mariposite, quartz and sulphides (Boyle, 1979).
(10)	**Diorite** Youngest (?)	Varies from diorite to granodiorite. Composed of quartz, plagioclase, biotite, hornblende and rate pyroxene.

Table B

Rock Sample Descriptions

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
GC-87-001	Piebiter Ck - Below Royal Cirque	Grab/Talus	-	Intrusive with feldspar, quartz and muscovite, carbonate altered with coarsely crystalline (+0.5 mm) pyrite disseminations to 1%.	nd
GC-87-002	Butte IXL	Grab/ Adit Dump	-	Quartz vein with dark grey silicified and/or chloritized fragments with discontinuous lenses and patches of pyrrhotite, pyrite +/- chalcopyrite and sphalerite(?).	180 13.5
GC-87-003	McGillivery Pass Chopper Vein	Grab/ Outcrop and Talus	-	Quartz vein with up to 50% stibnite, locally yellowish alteration.	40 59.3
GC-87-004	Royal Cirque	Grab/ Outcrop	-	Quartz diorite, minor shearing with rust weathering, 2-3% disseminated pyrite.	nd
GC-87-005	Royal Cirque	Chip/Grab	2.5 m	Quartz vein to 8 cm within a carbonate altered intrusive to silicified volcanic, cross-cutting the intrusive/volcanic contact. Disseminated crystalline pyrite (1-5 mm) to 5%.	nd
GC-87-006	Royal Cirque	Grab/ Outcrop	-	Quartzite, rust weathering, up to 1% crystalline pyrite (2-3 mm) as disseminations with fine-grained (1 mm) pyrite on fracture surface.	nd
GC-87-007	Royal Ridge Chopper Vein Station 2+53S	Grab/ Outcrop	-	Dolomite, well foliated, cut by quartz vein (2-3 mm) with malachite staining. Disseminated crystalline pyrite (1-2 mm) to 2%.	nd

Sample	Location	Type	Width	Description	Au (ppb)
GC-87-008	Royal Cirque Below Chopper Vein (?) West Side	Grab/Talus	-	Quartz vein, crystalline pyrite (to 1 mm) along fractures to 2-3%.	5
GC-87-009	Head Royal Cirque/Stream Draining Southwest Side	Grab/ Outcrop	-	Metavolcanic, foliated, pyrite to 3-5% along factures.	100
GC-87-010	Head Royal Cirque/Stream Draining Southwest Side	Grab/ Outcrop	-	Quartzite, several thin (to 1 cm) quartz veins cut by shear. Skarn hosts crystalline pyrite to 1%.	nd
GC-87-011	Head Royal Cirque	Grab/ Outcrop	-	Quartz vein/pod (3 m x 1 m) adjacent to shear. Massive, white with limonite fractures. Minor (1%) disseminated sulphide (pyrite?).	120
GC-87-012	Head Royal Cirque	Grab/Talus	-	Quartzite crosscut by quartz veining. Pyrite along fractures to 5%.	10

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-001	W. Side MacGillivray Pass South of Grid	Chip		Hornfelsic sediment(?), brown weathering. Quartz veins and minor carbonate. Limonitic fractures, 1-2% magnetite(?). Bedding @ 333°/85°W.	
TC-87-002	W. Side MacGillivray Pass South of Grid 3 m Upslope of Previous Sample	Grab	-	Light brown weathering 3 m thick. Altered ultramafic(?). Biotite phenos in greenish matrix. Fine pyrite stringers. Occasional carbonate pods. Jointing: 070°/80°S, 016°/40°W. Shear: 325°/80°W.	90
TC-87-003	Standard Grid At 75 m Elevation & 019° From L0+00 5+00E	Grab	-	Volcanic. Rusty brown weathering. Fine to medium-grained. Jointed @ 268°/60°N.	5
TC-87-004	Standard Grid 0+00, 1+SSE	Float	-	Light brown weathering talcose rock. Minor serpentine inclusions. Possible subcrop.	nd
TC-87-005	Standard Grid 0+10N, 2+70E	Chip	-	Argillite. Sheared. Trends 320°/40°E dip.	nd
TC-87-006	Standard Grid 0+10N, 2+70E	Chip	-	20 cm thick competent rock with quartz stringers. Slightly silicified.	nd
TC-87-007	Standard Grid 0+00, 3+73E	Grab	-	Black "gunk" appears to be sheared argillite. Contains stringers and pods of hematized material.	nd
TC-87-008	Standard Grid 0+00, 3+50W	Grab	-	Massive grey weathering, fine-grained rock. Black on fresh surface. Hornfelsic in appearance. Jointing @ 050°/20°SE.	65

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-009	Standard Grid 4+87N, 0+25E	Grab	-	Meta-argillite. Black fine-grained crystalline rock containing fine-grained disseminated pyrite. Rusty weathering. Jointed at 285°/83°S.	5
TC-87-01 0	Standard Grid 4+80N, 4+85E	Grab	-	Graphitic argillite with siliceous interbeds. Jointed @ 100°/38°N.	5
TC-87-011	Standard Grid 4+45N, 5+20E	Grab	-	Shear breccia. Foliated rock with rounded to subrounded quartz clasts in chloritic matrix. Trends @ 290°/45°N dip.	nd
TC-87-012	Standard Grid 3+40N, 4+60E	Grab	-	Quartzite cut by numerous white quartz veinlets to 1 cm. Shearing evident with chloritic foliation.	nd
TC-87-013	Standard Grid 4+10N, 2+95E	Grab	-	Quartz vein. Heavily fractured. Hematized fractures. Jointed at 268°/48°N dip.	
TC-87-014	Standard Grid 3+55N, 2+00E	Grab	-	Well bedded and jointed. Rusty weathering. Grey quartz veins to 2 cm along foliation. Jointed @ 295°/50°N.	nd
TC-87-015	Standard Grid 3+55N, 1+90E	Grab	-	Brown weathering rock highly altered. Indeterminate composition. Possible quartz feldspar dike.	nd
TC-87-016	Standard Grid 3+80N, 1+80E	Grab	-	Rusty weathering bedded rock with blebs of bright green mariposite. Very small exposure.	nd
TC-87-017	Standard Grid 4+00N, 1+75E	Grab	-	Rusty broken o/c. Similar in composition to previous two samples. Minor quartz veining. Minor mariposite.	nd
TC-87-018	Standard Grid 3+95N, 1+70E	Grab	-	Talc rock with minor serpentine and carbonate. Cut by narrow quartz veins.	10

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
TC-87-019	Standard Grid 3+50N, 0+50E	Grab	-	Serpentinite dark green altered ultramafic. Composed largely of serpentine and minor talc.	nd
TC-87-020	Standard Grid 3+50N, 0+10E	Chip	-	Listwanite. Brown weathering. Composed of quartz, carbonate, mariposite and 3% disseminated pyrite. Weakly foliated at 310°/80°E. Quartz veining at approximately 030°/50°S dip.	nd
TC-87-021	Standard Grid 3+50N, 0+15E	Grab	-	Quartz veining and listwanitic material from outcrop.	nd
TC-87-022	Standard Grid 5+40N, 1+00E	Grab	-	Quartz rich material with disseminated pyrite. Similar to material at 3+50N, 0+10E. Jointed/sheared @ 330°/32°E.	nd
TC-87-023	Standard Grid 5+45N, 1+25E	Grab	-	Talc rock with minor serpentinite. Similar to TC-87-018. Foliated/sheared @ 325°.	nd
TC-87-024	Standard Grid 5+48N, 1+60E	Grab	-	Listwanite in contact with sheared argillite. Mariposite rich. Contains narrow quartz veins to 1 cm. Trends 325°/80°E.	nd
TC-87-025	Standard Grid 5+80N, 1+15E	Grab	-	Trench trending 065°. Quartz veining and listwanite. Similar to TC-87-020.	nd >100
TC-87-026	Standard Grid 6+95N, 2+15E	Grab	-	Small outcrop. Argillite and quartzite cut by minor quartz veins. Hematite in vugs and along fractures.	nd 7.1
TC-87-027	Standard Grid 8+25N, 5+00E	Grab	-	Quartz vein in diorite. Veins vary from 1-4 cm. Trend 236°/35°N.	nd
TC-87-028	Standard Grid 9+95N, 2+55E	Grab	-	Graphitic argillite. Heavily fractured. Numerous quartz veinlets to 2 mm. Bedding/jointing @ 298°/55°N.	nd

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
TC-87-029	Standard Grid 6+40N, 0+20W	Grab	-	Variably altered ultramafic. Minor quartz veining and 1-2% disseminated pyrite. Secondary biotite on fractures. Jointed @ 285°/60°N dip.	nd
TC-87-030	Standard Grid 2+25N, 5+00W	Grab	-	Fine-grained hematized diorite within unaltered diorite. 3-5% pyrite. Cut by quartz veins to 25 cm.	nd
TC-87-031	Standard Grid 2+25N, 5+00W	Grab	-	Quartz vein material from above. Contains vugs with euhedral quartz crystals. Limonitic fractures.	5
TC-87-032	Standard Grid 2+50N, 3+80W	Grab	-	Rusty to grey weathering hornfelsic rock. Somewhat volcanic in appearance.	5
TC-87-033	East of Mount MacGillivray on Ridge Between Mt. MacGillivray and Piebiter Peaks	Grab	-	Listwanite.	10
TC-87-034	Location as Above TC-87-033	Grab	-	Quartz material from Chopper Vein. Oxidized fracture fillings 2 metres thick. Trends 305°/80°SW dip.	50
TC-87-035	As Above	Grab	-	Quartz material from Chopper Vein. 1.5 m thick. Within altered porphyry. Trends 320°/60°SW dip.	410
TC-87-036	S.W. Flank of Royal Peak at 2,300 m Elevation	Grab	-	Quartz vein cutting granodiorite. Hematite and malachite on fractures. Trends 290°/55°S dip.	5 >100
TC-87-037	S.W. Flank of Royal Peak at 2,280 m	Grab	-	Quartz vein 1.5 m wide. Similar trend to previous. Located approximately 20 m to south. Cuts hematized metasediments.	5 4.8

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
TC-87-038	Fault Zone N.W. of Red Hawk Cirque	Grab	-	Quartz from trench trending 047° across sheared diorite containing quartz veins to 5 cm. Minor pyrite. Several trenches in vicinity.	10
TC-87-039	TC-87-033 Location	Grab	-	Stibnite sample from Chopper Vein.	nd 41.7
TC-87-040	Chopper Cirque Area	Grab	-	Chopper Vein. Quartz with galena, tetrahedrite and pyrite.	5 >100
TC-87-041	Piebiter Grid 4+65S, 0+50E	Grab	-	Oxidized volcanics cut by 10 cm granodiorite dike. Hornfelsic zone approximately 1 m wide contains 5-7% disseminated pyrrhotite.	nd
TC-87-042	Piebiter Grid 4+00S, 0+20E	Grab	-	Similar to previous sample collected from talus. 7-10% fine-grained pyrrhotite.	50
TC-87-043	Piebiter Grid 4+10S, 0+55E	Chip	-	Hematized sediments cut by 1.6 m wide diorite dike trending 090°. East side of dike comprises quartzite to quartz biotite schist.	nd
TC-87-044	Piebiter Grid 4+10S, 0+60E	Chip	-	Same locale. Comprises less hematized sedimentary rock than previous.	55
TC-87-045	Piebiter Grid 2+55S, 0+50E	Chip	-	Altered volcanics between two diorite dikes. Heavily hematized, biotite rich. 1-2% pyrite stringers.	nd
TC-87-046	Piebiter Grid 3+00S, 0+96E	Chip	-	Hornfels. Highly siliceous. Grey/brown in colour. 2-3% disseminated and stringer pyrite.	nd
TC-87-047	Piebiter Grid 3+40S, 0+62E	Chip	-	Highly hematized, fine-grained rock to biotite stringers. 2-3% disseminated pyrrhotite and minor pyrite. Altered volcanics(?)	nd

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-048	Piebiter Grid 3+35S, 0+70E	Chip	-	Highly hematized fine-grained rock to abundant disseminated pyrrhotite and minor pyrite. Possible altered volcanic.	nd
TC-87-049	Red Hawk	Grab	-	Quartz material with chlorite, minor carbonate and limonite from dump of adit in chloritized diorite.	nd
TC-87-050	Butte X-Cal	Grab	-	Quartz from vein at upper adit on Butte X-Cal. Contains limonitic material.	nd
TC-87-051	Red Hawk	Grab	-	Serpentinite (soapstone containing 20-30% dark brown sideritic(?) material). Contains 1% unoxidized pyrite. East side Red Hawk Cirque.	nd
TC-87-052	Slope Below Red Hawk Area @ 1,660 m	Grab	-	Quartz vein material from trench.	nd
TC-87-053	Red Hawk	Grab	-	Sheared serpentinite. Heavily hematized on fractures. Locally brecciated.	nd
TC-87-054	Standard Grid 3+80N, 1+80E	Chip	-	Porphyry from trench to TC-87-016 location. Abundant mariposite calcite on fractures. 1 mm quartz stringers. No visible sulphides. Jointing @ 102°/55°N, 357°/75°W.	nd
TC-87-055	Standard Grid 3+80N, 1+81E	Grab	-	Talc and gouge zone from above trench. Poddy.	nd
TC-87-056	Standard Grid 3+30N, 1+82E	Chip	-	Broken argillite from east end of above trench. Hematized fractures. No sulphides evident.	5
TC-87-057	Standard Grid 3+10N, 2+05E	Grab	-	Altered rock (ultramafic?) cutting sheared argillite in stream bed.	nd

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-058	Standard Grid 4+10N, 2+95E	Chip	-	TC-87-013 location. Broken quartz vein. Hematized fractures. 1.0 m x 0.5 m exposure.	nd
TC-87-059	Standard Grid 4+10N, 2+95E	Chip	-	Same location as above. Contains very fine-grained sulphides and fragments of bleached country rock.	5
TC-87-060	Stanard Grid 3+55N, 1+96E	Grab	-	TC-87-014 location. Quartz vein material cutting sheared argillite in trench.	nd
TC-87-061	Standard Grid 3+55N, 2+00E	Chip	-	Repeat of TC-87-014 sample. Sheared argilite. Hematized fractures cut by occasional quartz veinlets to 2 cm in size.	nd
TC-87-062	Stanard Grid 3+50N, 1+98E	Chip	-	Sheared argillite with heavily hematized fractures immediately to south of 014 outcrop.	65
TC-87-063	Standard Grid 3+55N, 1+88E	Chip	-	Sheared argillite(?) below quartz vein (TC-87-060). Rusty, well fractured rock. No bedding evident. Possible volcanic(?)	10
TC-87-064	Standard Grid 3+55N, 1+92E	Grab	-	Ankeritic material at east end of TC-87-015 area. Vein 25 cm in width composed of quartz, ankerite and hornfelsed sedimentary material. Mariposite on contacts.	nd
TC-87-065	Standard Grid 3+55N, 1+90E	Grab	-	Quartz veining in fine-grained quartz feldspar porphyry. Minor pyrite. Limonitic fractures.	5
TC-87-066	Standard Grid 3+80N, 1+80E	Soil	-	Dark red soil sample from vicinity of TC-87-016.	nd
TC-87-067	Standard Grid 4+00N, 1+75E	Chip	-	Rusty brown highly altered and sheared rock with remnant feldspar(?) phenos. Ubiquitons mariposite. Occasional quartz pods.	nd

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-068	Standard Grid 3+97N, 1+72E	Grab	-	Outcrop in trench. Fine-grained medium to dark brown rock of possible ankeritic composition.	nd
TC-87-069	Standard Grid	Grab	-	Talc rock cut by hematized shears to 5 mm.	nd
TC-87-070	Standard Grid	Grab	-	Quartz vein material from TC-87-067 location.	nd
TC-87-071	Standard Grid	Chip	-	TC-87-013 location. Quartz vein material.	nd
TC-87-072 TC-87-073	Standard Grid 3+10N, 2+06E	Chip	-	Sheared rusty argillite exposed in creek bed. Fine-grained pyrite on occasional fractures. Pervasive limonitic alteration.	
TC-87-074 TC-87-074A	Standard Grid 0+90N, 2+40E	Chip	-	Broken rusty rock in subcrop. Probable argillite.	70 5
TC-87-075	Standard Grid 0+00, 3+75E	Chip	-	Broken hematized rock similar to TC-87-074. Probable argillite.	5
TC-87-076	Standard Grid 3+75N, 1+50E	Grab	-	Quartz vein 0.5 m thick exposed in creek bed.	nd
TC-87-077	Standard Grid 3+75N, 1+50E	Grab	-	Altered rock cut by above quartz vein. Minor visible arsenopyrite.	nd
TC-87-078	Butte X-Cal	Grab Chip	-	Rusty light brown weathering rock. Weakly foliated. Appears to be intrusive in origin. Cut by occasional quartz vein to 2 cm. Altered aplite(?) Jointing @ 333°/75°N. Shearing @ 099°/74°N.	500
TC-87-079	Butte X-Cal	Grab	-	Highly altered intrusive rock. Possible ultramafic. Cut by quartz veins to 5 cm. Pale green talc in vicinity.	5

Sample	Location	Type	Width	Description	Au (ppb)
TC-87-080	Butte X-Cal	Grab	-	Float from cirque at head of Aggie Creek. Listwanitic in appearance. Similar to rocks at Standard Adit.	nd
TC-87-081	Butte X-Cal	Grab	-	Similar to 080. Outcrop consisting of highly rusty rock at contact between serpentinized ultramafic and argillite. Cut by abundant quartz veining to 1-2 cm. Some quartz, chalcedonic in appearance.	nd
TC-87-082	Butte X-Cal			10 m uphill from previous sample. Medium grey seemingly brecciated rock cut by occasional quartz veinlets to 3 mm. Contains mariposite and disseminated magnetite.	nd

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
JF-87-001	Standard Grid 5+80N, 0+65E	Grab Float From Old Trench	-	Massive to coarsely crystalline vuggy white quartz, patches of disseminated pyrite, disseminated blue grey material with grey streak unidentified, minor mariposite, trace galena, trace malachite.	nd 100
JF-87-002	Royal 85 Metres at 85° from the Royal Adit	Grab/ Float	-	Massive, milky white quartz, no visible sulphides, evidence of weathered out pyrite.	nd 12.8
JF-87-003	Royal 75 Metres at 70° from the Royal Adit	Grab	-	Strongly chloritized and silicified diorite, rusty on weathered surface, 1% pyrite and pyrrhotite as pods and disseminations, trace chalcopyrite on periphery of pyrite, mineralization associated with lenses and small stringers of quartz.	nd 6.1
JF-87-004	Royal Trench Located 20 Metres Above the Royal Adit Portal	Chip	2.3 m	Massive, milky white quartz vein, locally rusty weathering on fractures, no visible sulpides, evidence of weathered out pyrite, width and orientation of vein not discernible.	nd
JF-87-005	Royal In Royal Creek 12 Metres at 130° from Royal Adit Portal	Grab	-	Massive, milky white quartz vein, locally rusty weathering on fractures, quartz vein 15 cm wide and oriented at 50°/20S.	nd

Sample	Location	Type	Width	Description	Au (ppb)
JF-87-006	Royal Northside of Road 160 Metres East of Where Line 10 Meets the Road	Grab/ Float	-	Fine-grained diorite, chloritized and silicified, grain boundaries still visible, quartz stringers and lenses noted locally, 1/2% pyrite as disseminations.	nd
JF-87-007	Royal	Chip	1.0 m	Massive, milky white quartz vein, approximately 1.0 m wide, oriented 164° and dips steeply to the east; no visible sulphides.	nd
JF-87-008	Royal	Grab	-	5 cm wide quartz vein oriented at 31° and dips 68 southeast, milky white, locally vuggy texture, no visible sulphides.	220

Sample	Location	Type	Width	Description	Au (ppb) Ag (ppm)
JW-87-001	Lower Piebiter 3rd Switchback Drilling Access Road	Chip	1.0 m	Sheared serpentinite.	nd
JW-87-002	Upper Piebiter	Rock Sample from Outcrop		Metasediments. Quartzite/? equigranular, foliated, up to 1% disseminated sulphide/pyrrhotite.	nd
JW-87-003	Western Side of Standard Creek Grid	Grab/ Float from Ridge Top	-	Foliated polymictic conglomerate/agglomerate Angular to rounded clasts of variable size in fine-grained oxidized matrix. Trace of pyrite up to 1%.	nd
JW-87-004	Western Side of Standard Creek Grids @ 2+00N, 4+75W	Grab/ Float in Talus Slope	-	Quartzite/pyrite. Weathering smooth reddish orange to form rounded cobbles - boulders. Fine equigranular massive, pinkish to greenish grey assemblage (secondary biotite with chlorite?) No apparent sulphide mineralization.	5
JW-87-005	Western Side of Standard Creek Grid @ 2+50N, 4+15W	Grab/ Float	-	Quartz vein material, iron oxide staining, no apparent mineralization.	nd
JW-87-006	Ridge Traverse			Hand specimen, marginal phase of intrusive quartz diorite.	nd
JW-87-007	Piebiter Creek Below Royal Cirque C.G.'s	Grab Sample of Talus Below Cliff Face/ Exposure		Altered intrusive pink-orange, feldspar altered locally to clay, hematitic stained, mafics to chlorite, carbonate disseminated throughout. Irregular clusters of pyrrhotite up to 5% with trace chalcopyrite.	nd
JW-87-008	Piebiter Creek	Grab/ Float	-	Quartz vein material, distinct odour of As when struck by hammer. Grains of pyrite (up to 2 mm) up to 1-2%.	nd 5.9

Sample	Location	Type	Width	Description	Au (ppb)
JW-87-009	Butte IXL	Grab/Dump Material	-	Chlorite rich material locally silicified, cut by thin (1-3 mm) quartz veinlets. Disseminations and stringers of pyrrhotite and possibly sphalerite.	nd
JW-87-010	Butte X-Cal	Grab/Dump Material	-	Quartz vein material (0.3 m) within fine-grained, feldspar rich aplite dyke. Local clay alteration of dyke. Fine-grained (1 mm) disseminations of limonite and some sulphides (pyrite?).	nd
JW-87-011	Red Hawk	Grab	-	Sample of quartz collected from dump of collapsed adit. Believed to be Gopher Tunnel of old reports.	nd
JW-87-012	FL 0+25W	Grab Sample of Talus	-	Silicified metavolcanics, fine-grained equigranular, massive, slightly chloritized with disseminations of pyrrhotite (up to 1-2%).	nd
JW-87-013	FL 0+25W	Grab/ Float Along Ridge Top	-	Chlorite schist/sheared metavolcanics, fine equigranular chloritized, layers consisting of sericite/hematite containing cubes of pyrite (up to 1 mm) at approximately 5%.	nd
JW-87-014	FL 1+25W	Grab/ Float	-	Chloritized mafic volcs, weathers rusty brown on irregular fracture surfaces, fine equigranular, no apparent mineralization.	nd
JW-87-015	FL 3+68W	Grab/Dump Material Near Trench	-	Buff to brown, hand semi-conchoidal fracture, fine equigranular massive amphibolite weakly chloritized disseminated sulphide (up to 5%) dry magnetite on irregular fracture surfaces.	5
JW-87-016	FL 8+78W	Grab/Dump Material Near Trench	-	Fine-medium equigranular quartzite oxidized on weathered surface weakly chloritized. Occasional cubes of pyrite (0.2 mm) (up to 0.5%).	nd

Sample	Location	Type	Width	Description	Au (ppb)
JW-87-017	FL 8+78W	Chip Sample Across 60 cm of Quartz Vein	-	Quartz vein material with abundant weakly hematized fractures running across trench (312/66).	nd
JW-87-018	FL 8+78W	Rock Sample from Trench	-	Rock sample from fine silicified metaseds adjacent to quartz vein. Vuggy: no apparent mineralization.	nd

2.3 Mineralization

The Cadwallader Gold Belt is characterized by the association of gold bearing quartz veins with a complex northwest trending fault system that occupies the Cadwallader Creek Valley. Altered ultramafics (serpentinites) are closely associated with the fault system and gold mineralization. Structural controls on the mineralization are best described by Joubin (1948) in Structural Geology of Canadian Ore Deposits. Joubin indentifies the serpentinite contact as one of the important ore controls in the Bralorne-Pioneer Complex.

A number of northwest trending structures and altered ultramafic (serpentinite, listwanite) bodies (fault emplaced?) have been identified on the Standard Creek Property and are believed to be extensions of the Cadwallader Gold Belt. Cairnes (1937) in Geology and Mineral Deposits of the Bridge River Mining Camp describes several prospects (Standard, Royal, Butte-I.X.L., Red Hawk) associated with these structures. Clothier (1933) reports that a crosscut adit driven on the Standard prospect intersected a 21 metre zone that would average 4.3 grams/tonne (0.125 oz/ton) gold. Exploration efforts on the Standard Creek Property continue to identify mineralized areas.

3.0 GEOPHYSICS

Approximately 27.0 kilometres of grid line was placed on the Standard (15.0), Chopper (1.4), Royal (1.2), Piebiter (3.9) and Red Hawk (5.5) zones for geophysical (VLF/EM, magnetic) and geochemical surveys. The grids were established by hip chain and compass traverses and appropriate base lines were selected for control.

3.1 Methods and Procedures

Magnetometer surveys were carried out on the Standard, Chopper, Royal and Piebiter grids. Stations were selected at 10 or 25 metre intervals along grid lines and magnetic data was collected using a Scintrex MP-3 Proton Magnetometer. Data was corrected for diurnal variation using the loop method.

VLF/EM surveys were carried out on the Standard, Chopper, Piebiter and Red Hawk grids. Data was collected from 10 or 25 metre stations using a Geonics EM 16 VLF-electromagnetic receiver tuned to Jim Creek (Seattle), Washington or Cutler, Maine.

3.2 Presentation of Results

The results of the geophysical surveys are shown on drawings GP 1000 to GP 1013 inclusive at a scale of 1: 2,500 and 1:5,000.

Magnetic data (total intensity) has been contoured and is presented as relative values using a base of 57,000 gammas. VLF/EM data is shown in both Fraser Filter and profile (basic data) form. Interpretation and evaluation of the results are discussed in Section 5.0.

4.0 GEOCHEMISTRY

4.1 Sampling, Sample Preparation and Analytical Procedure

Soil samples were collected from four of the five grids on the Standard Creek Property. Soil sample lines were run perpendicular to the base line and spaced every 50 metres. Soil sample sites were chosen every 25 metres and the sample site was marked on flagging tape. Soil samples were selected from the 'B' horizon wherever possible. Samples were normally collected with a "tree planters" shovel from 30 to 50 cm deep. A total of 534 soil samples were collected from the Standard (123), Piebiter (186), Royal (50) and Red Hawk (175) Grids.

All samples were placed in Kraft paper envelopes and shipped to Vangeochem Lab Ltd. in North Vancouver, B.C. for Au and ICP analysis. Sample preparation and analytical procedures are given in Appendix II.

A total of 121 rock samples were collected in conjunction with the geological mapping of the property. An additional 34 rock samples were collected from surface mineralization covered by the Piebiter Grid. All samples were shipped to Vangeochem Lab. Ltd. for Au and ICP analysis. Rock sample preparation and analytical procedures are given in Appendix II.

4.2 Presentation of Results

Arsenic and gold results are shown in drawings GC 1000 to GC 1005 inclusive at a scale of 1:2,500. The results have been selectively contoured. A complete listing of analytical results for soil and rock samples are included in Appendices III and IV. Interpretation and evaluation of the results are discussed later in the report (Section 5.0).

5.0 DISCUSSION OF RESULTS

Detailed geological, geophysical and geochemical surveys were carried out on five areas of interest. Limited investigations were carried on the Butte-I.X.L., Butte-X-Cal and Chalco/Lower Piebiter areas. Results are encouraging and are summarized below.

5.1 Standard Zone

The Standard grid covers a number of old workings centering around the Standard Adit (0 + 00, 5 + 00N). The adit (caved and inaccessible) is reported by Cairnes (GSC Memo 213) and Clothier (BCDMAR, 1933) to have crossed a 21 metre, northly trending mineralized section averaging 4.3 grams/tonne (0.125 oz./ton) gold with gold values up to 5.8 grams/tonne (0.17 oz./ton). Cairnes also reports that trenching was carried out on several zones of interest including: Zone (1) a 1.2 metre wide quartz vein, Zone (2) a well defined ridge with a 4.5 - 6.0 m zone of highly sheared rock containing quartz veins and mariposite and zones (3), (4) sheared and talcose carbonate rocks above and below the adit.

Geophysical and geochemical surveys on the Standard grid clearly outline the zones identified by Cairnes. VLF/EM surveys (Dwg. GP 1001) show two well defined northwest-southeast trenching conductors above the Standard Adit. The conductors run parallel to Standard Creek, are approximately 150 metres apart and can be traced for over 1000 metres. The lower conductor corresponds with Cairnes Zone (2). Results of the magnetometer survey show a highly magnetic zone southeast of the Standard adit (0 + 50 E, 3 + 50 N). The zone is coincident with several isolated outcrops of altered ultramafics.

Soil sample results are consistent with earlier sampling and outline a large (200 x 500 m) northwest-southeast trending arsenic anomaly (Dwg. GC 1000) near the Standard Adit. The anomaly is open northwest of the adit

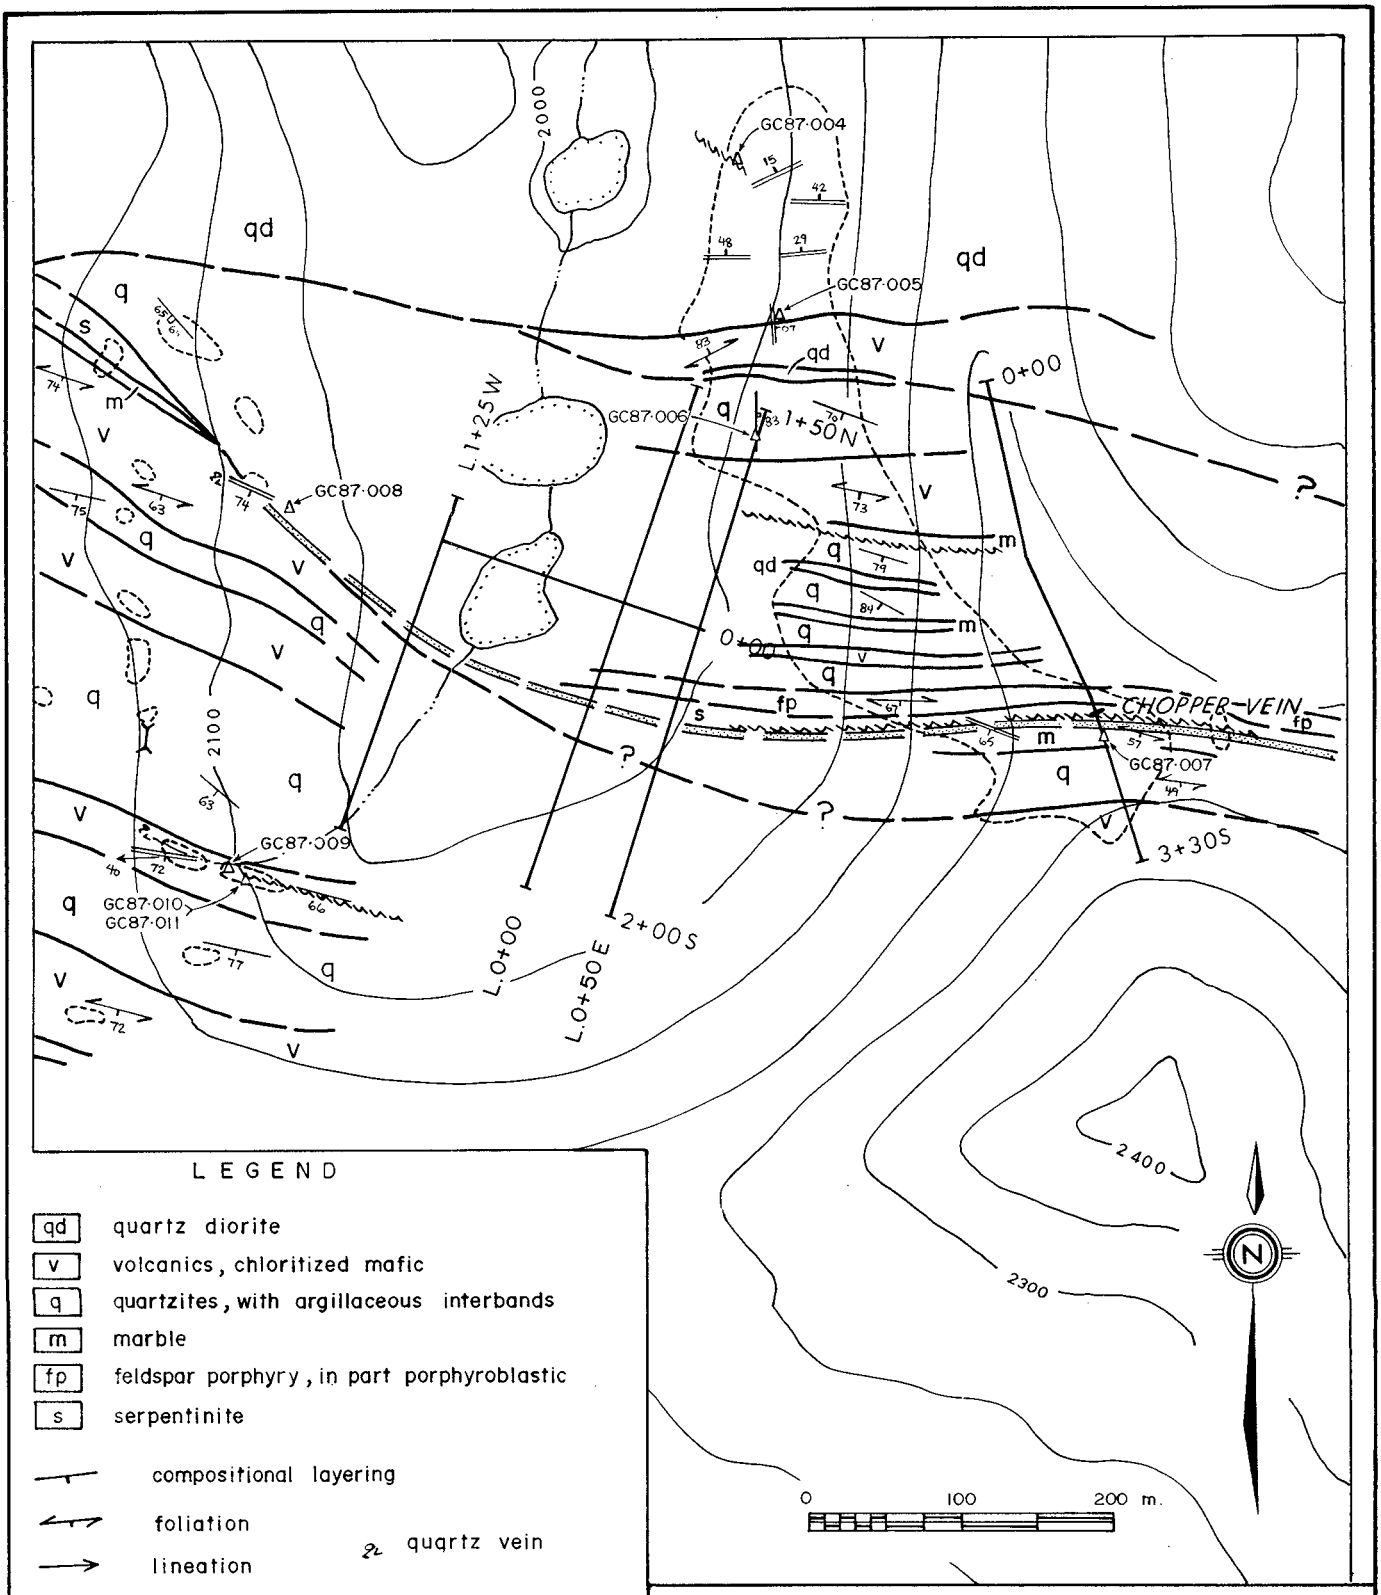
and southeast of the survey area. The anomaly shows sharp side boundaries. The northwest boundary corresponds with the lower VLF/EM conductor and the southwest boundary with Standard Creek. Rock samples with highly anomalous arsenic values (up to 6586 ppm) occur within the soil anomaly.

Geological mapping (Dwg. G 1000) has indentified several outcrops of listwanite (altered ultrabasics) on the Standard grid. Two of the outcrops are believed to be Cairnes Zone (3), 5 + 50 N, 1 + 50 E, and Zone (4) 3 + 50 N, 0 + 00. Silver bearing quartz veins were found north and slightly east (1 +15 E, 5 +80 N; 2 +15 E, 6 +95 N) of the Standard Adit. Rock samples collected from these two locations carried 100 ppm and 7.1 ppm silver respectively.

5.2 Chopper Zone

On the northeastern boundary of the property, the "Chopper Vein" occurs along a major west-northwesterly trending vein structure. The vein dips from 65° to 74° to the south and can be traced intermittently for 1,600 metres. Widths vary from 2 to 10 metres and average 3 metres. Values of up to 1585 grams/tonne (46.36 oz./ton) silver are reported by earlier workers (E. Sheppard, 1979).

Geological mapping (Dwg. G 1001) of the Chopper zone suggests the vein occupies a major fault structure and has identified serpentinite bodies closely associated with the vein. Reconnaissance rock geochemical sampling (Dwg. GC 1001) shows elevated values for gold and arsenic. The results of VLF/EM and magnetometer orientation surveys (Dwg. GP 1003-GP 1007) designed to trace the vein structure to the northwest were inconclusive.



LEGEND

- qd — quartz diorite
- v — volcanics, chloritized mafic
- q — quartzites, with argillaceous interbands
- m — marble
- fp — feldspar porphyry, in part porphyroblastic
- s — serpentinite

- compositional layering
- foliation
- lineation
- jointing
- dyke or vein
- geological contact (defined, assumed)
- shear
- outcrops examined
- quartz vein
- Chopper Vein (defined, assumed)

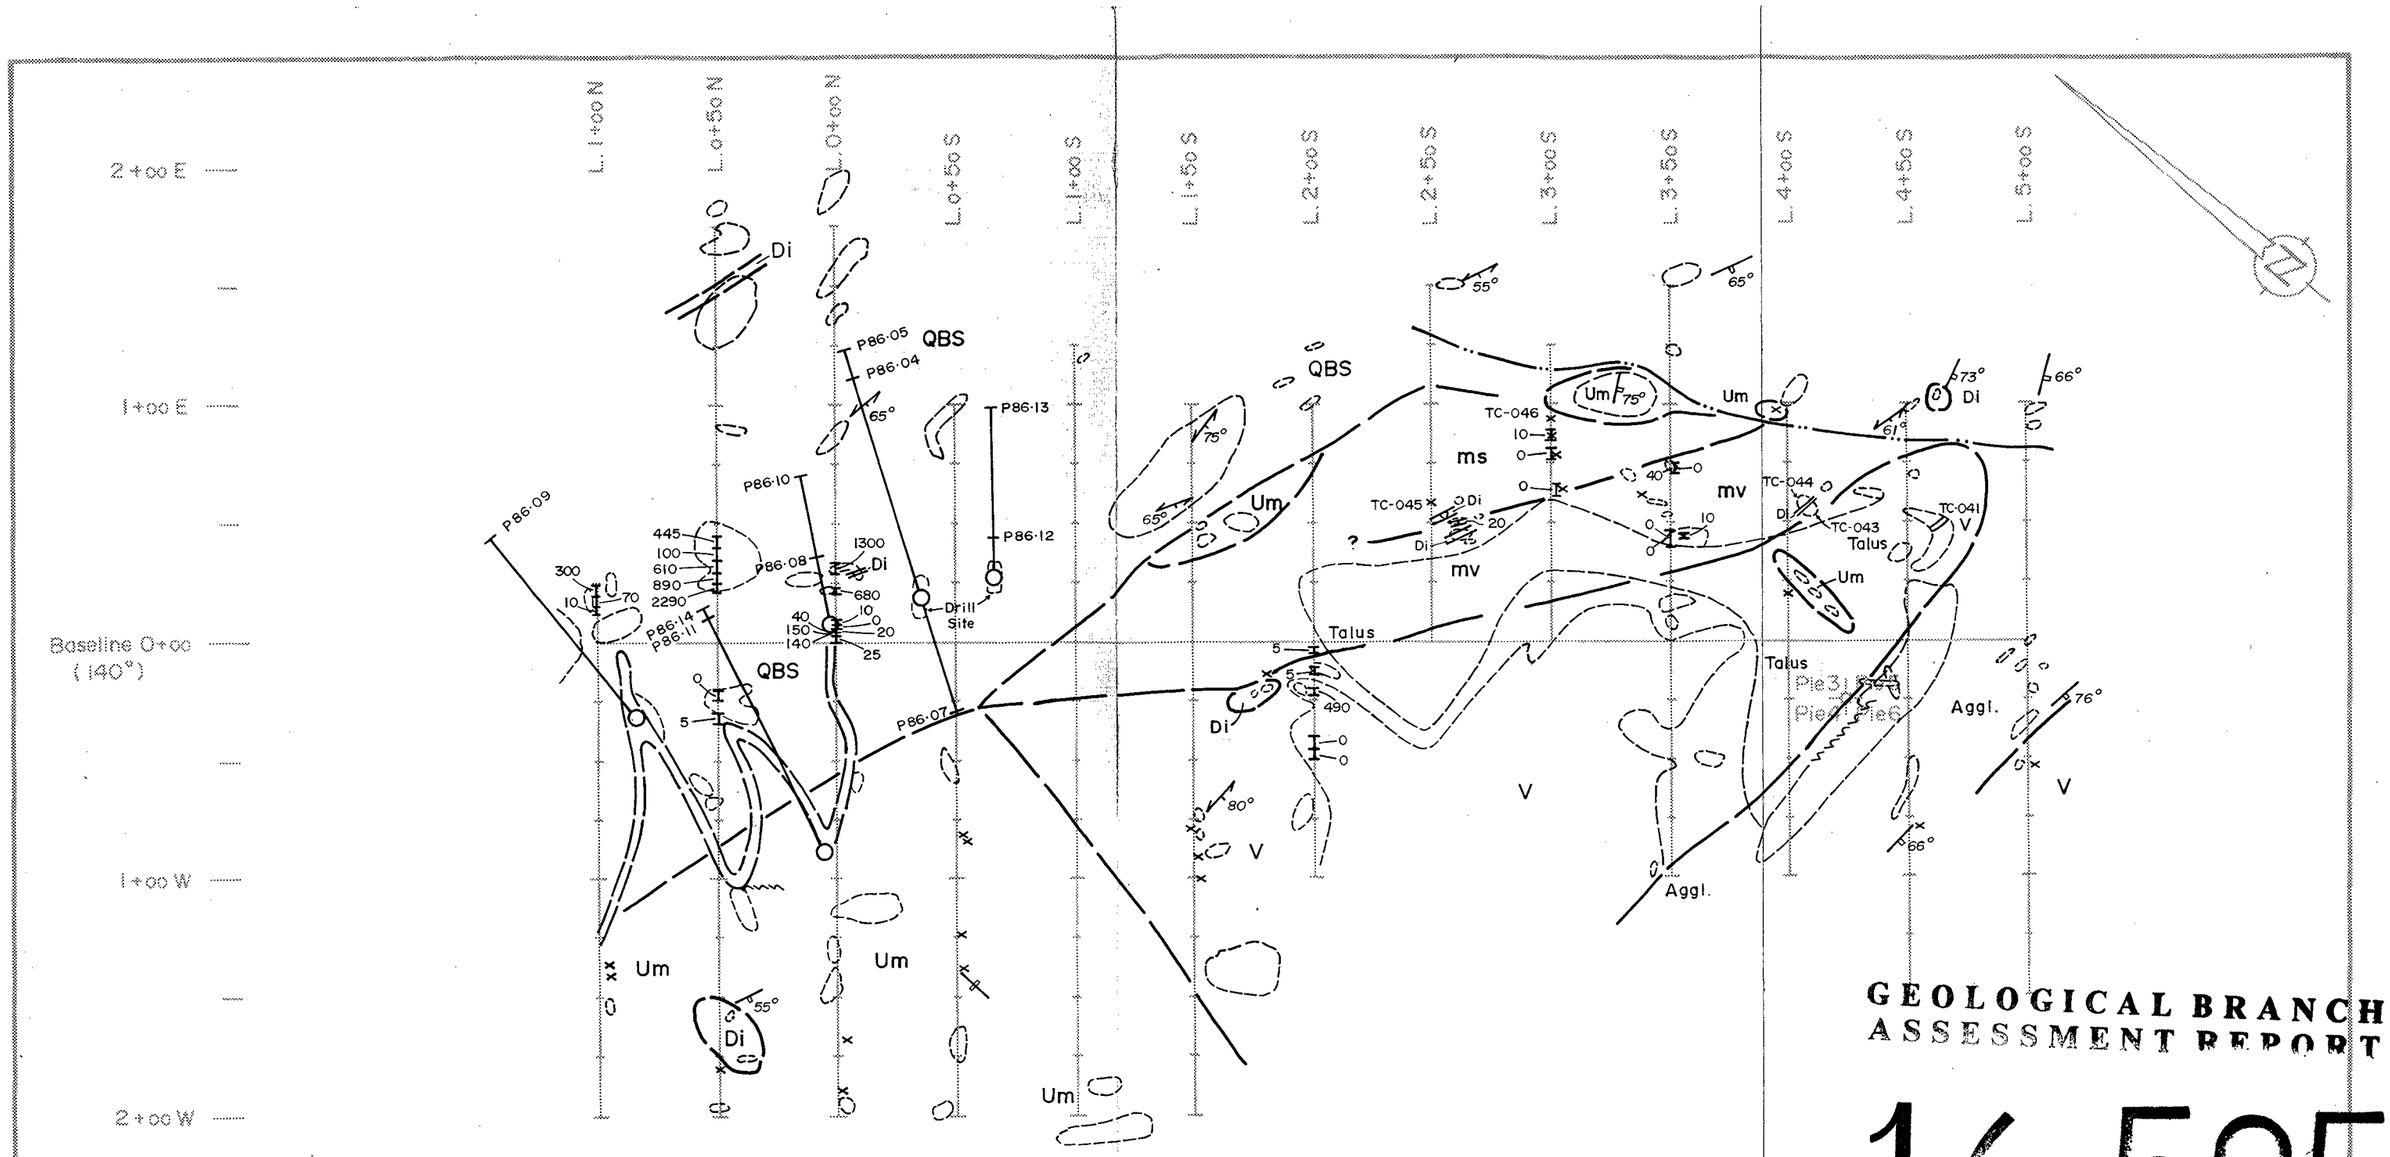
5.3 Upper Piebiter Zone

The Upper Piebiter Zone was discovered in 1985 and is exposed on surface as a large (60m x 150m) iron stained quartz-biotite schist (metavolcanic ?). Drill testing of the zone in 1986 partly defined a 15-35 metre wide zone averaging 0.6-0.7 grams/tonne gold (0.02 oz/ton) with values up to 5.7 grams/tonne (0.16 oz/ton). Drill results suggest the zone may have a strike length of 600m and that the zone is open to the southeast.

The Piebiter grid was established with the discovery zone at the northwest corner (L0 + 50 N, 0 + 30E) of the gird. Results of the 1987 soil sampling (Dwgs. GC 1002 - 1003) show a strong gold - arsenic anomaly coincident with the discovery zone. Arsenic and gold soil results indicate a continuation of the zone to the southeast (L3 + 50S, 1 + 00E). A second soil anomaly occurs south of the main anomaly (L1 + 50S, 1 + 7S) and overlies altered ultramafics.

Strong VLF/EM conductors (Dwgs. GP 1008-1009) are associated with the principal anomalous zone. Results of the magnetometer survey (GP 1010) show several isolated high values but no general patterns.

Geological mapping (Dwg. G 1002) has identified several altered (serpentinized) ultramafics that are spatially related to the geochemical and geophysical anomalies.



Di - Diorite

Um - Ultramafics (serpentinized)

V - Massive volcanics

mv - Metavolcanics (schistose)

ms - Pelitic metasediments (possibly volcanics)

QBS - Quartz Biotite Schist (variable composition)

Aggl. - Agglomerate

5.4 Royal Zone

During 1986 two holes were drilled near Royal Creek to test near coincident geophysical (magnetics) and geochemical (Au-As) anomalies. The drill holes intersected quartz veins containing pyrite and molybdenite cutting silicified metasediments.

In 1987 a reassessment (soil sampling, magnetometer survey) of the anomalies was carried out. Geological mapping was completed in the vicinity of the Royal Adit. The 1987 work confirmed the presence of a northwest-southeast trending magnetic high (Dwg. GP 1011) and anomalous arsenic in soils (Dwg. GC 1004).

Results of the work suggest the anomalies have not been adequately drill tested.

5.5 Red Hawk Zone

A small grid was established near the Red Hawk showings to test anomalous Au values detected in a previous program by Hudson Bay Exploration and Development Co. The grid lies on the west side of Cadwallader Creek above the Butte-I.X.L. showing and north of the Butte--X-Cal. Results of geological mapping, VLF/EM surveys and soil sampling are shown on Drawings G 1004, GP 1012, GP 1013 and GC 1005.

Geological mapping has identified a number of sheared serpentinites with minor volcanics. These units are cut by occassional quartz veins and aplite dikes. Results of the geophysical and geochemical surveys did not identify any mineralized zones.

A reconnaissance line (FL) was started at L1 + 50 N, 0 + 75 E on the Red Hawk. The line was extended 900 m to the northwest along a major topographic lineament (fault line). Rock and soil sample results were all background levels.

5.6 Other Zones

Earlier workers have outlined a number of mineralized zones in the Butte-I.X.L., Butte-X-Cal and Chalco/Lower Piebiter aeas. Allen et al (1986) recommended additional work for these areas. The areas were briefly investigated during the 1987 programme.

All three of the areas examined exhibit a number of attractive geological features for gold bearing mineralization. These features included altered ultramafics, faulting and shearing, silicification and quartz veining. Rock samples collected from the Butte-I.X.L. (GC-87-002) and Butte-X-Cal (TC-87-078) zones carried highly anomalous gold values.

6.0 CONCLUSION AND RECOMMENDATIONS

Results of work during the 1987 Phase I programme and investigations by earlier workers on the Standard Creek Property has indentified four areas which exhibit excellent potential for gold bearing mineralization. Detailed exploration has highlighted drill targets on the Standard, Chopper, Royal and Upper Piebiter Zones. Exploration efforts have also identifed other zones of interest including possible extensions of the Standard and Piebiter Zones.

Continued exploration of the Standard Creek Property is recommended. A programme of diamond drilling is proposed for the four zones (Standard, Chopper, Royal, Piebiter). The caved Standard Adit should be reopened in conjunction with the diamond drilling and underground exploration carried out.

The programme of geological mapping, rock and soil sampling and geophysical surveys has been successful in defining potential gold zones within areas of interest. A similar programme should be continued for assessing other areas of interest on the property including the Chalco/Lower Piebiter, Butte-I.X.L. and Butte-X-Cal.

A two phased cost estimate for the recommended work is included as Section 7.0.

Respectfully submitted,

Thomas Carpenter, B.Sc., F.G.A.C.

Larry Haynes, B.Sc., F.G.A.C.

7.0 COST ESTIMATE

Phase I

Detailed geological mapping, geochemical surveys, geophysical surveys, road and drill site construction, diamond drilling of the Standard, Chopper, Royal and Piebiter zones, underground exploration.

Salaries		
Project Geologist	1 x 90 @ 275/day	24,750.00
Geologists	3 x 90 @ 200/day	54,000.00
Technicians	5 x 90 @ 175/day	78,750.00
Room and Board	810 mandays @ 40/day	32,400.00
Camp Mobilization and Demobilization		36,000.00
Camp Supplies and Rental		25,000.00
Vehicle Rental and Transportation		28,000.00
Helicopter Support	300 hours @ 550/hour	165,000.00

TO: AZIMUTH GEOLOGICAL SERVICE
#404 - 850 W. Hastings Street
Vancouver, B.C. V6C 1E1

FROM: Vangeochem Lab Ltd.
1521 Pemberton Ave.
North Vancouver, B.C. V7P 2S3

SUBJECT: Analytical procedure used to determine gold by fire-assay method and detected by atomic absorotion spec. in geological samples.

1. Method_of_Sample_Preparation

(a) Geochemical soil, silt or rock samples were received in the laboratory in wet-strength 4" x 6" Kraft paper bags or rock samples sometimes in 8" x 12" plastic bags.

(b) The dried soil and silt samples were sifted by hand using a 8" diameter 80-mesh stainles steel sieve. The plus 80-mesh fraction was rejected and the minus 80-mesh fraciton was transferred into a new bag for analysis later.

(c) The dried rock samples were crushed by using a jaw crusher and pulverized to 100-mesh for finer by using a disc mill. The pulverized samples were then put in a new bag for later analysis.

2. Method_of_Extraction

(a) 20.0 - 30.0 grams of the pulp samples were used. Samples were weighed out by using a too-loading balance into fusion pot.

(b) A Flux of litharge, soda ash, silica, borax, flour, or potassium nitrite is added, then fused at 1900 degrees F and a lead button is formed.

(c) The gold is extract by cupellation and part with diluted nitric acid.

(d) The gold bead is saved for measurement later.

3. Method of Detection

(a) The gold bead is disolved by boiling with sodium cyanide, hydrogen peroxide and amonium hydroxide.

(b) The gold analyses were detected by using a Techtron model AA5 Atomic Absorption Spectrophotometer with a gold hollow cathode lamp. The results were read out on a strip chart recorder. The gold values in parts per billion were calculated by comparing them with a set of gold standards.

4. The analyses were supervised or determined by Mr. Conway Chun or Mr. David Chiu and his laboratory staff.

David Chiu

SUBJECT: Analytical procedure used to determine multiple elements in hot acid soluble by Induction Couple Plasma Spectrometer (ICP) analysis.

1. Method_of_Sample_Preparation

(a) Geochemical soil, silt or rock samples were received in the laboratory in wet-strength 4" x 6" Kraft paper bags or rock samples sometimes in 8" x 12" plastic bags.

(b) The dried soil and silt samples were sifted by hand using a 8" diameter 80-mesh stainless steel sieve. The plus 80-mesh fraction was rejected and the minus 80-mesh fraction was transferred into a new bag for analysis later.

(c) The dried rock samples were crushed by using a jaw crusher and pulverized to 100-mesh or finer by using a disc mill. The pulverized samples were then put in a new bag for later analysis.

2. Method_of_Digestion

(a) 0.500 gram of -80 mesh sample was used.

(b) Samples were digested in a hot water bath with diluted aqua regia acids.

(c) The digested samples were diluted to a fixed volume and shaken well.

(d) The Au complex ions were extracted into diisobutyl ketone and thiourea medium. (Anion exchange liquids "Aliquot 336").

(e) Separate Funnels were used to separate the organic layer.

3. Method of Detection

The gold analyses were detected by using a Techtron model AA5 Atomic Absorption Spectrophotometer with a gold hollow cathode lamp. The results were read out on a strip chart recorder. A hydrogen lamp was used to correct any background interferences. The gold values in parts per billion were calculated by comparing them with a set of gold standards.

4. The analyses were supervised or determined by Mr. Conway Chun or Mr. Eddie Tang and his laboratory staff.

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,Fe,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

COMPANY: AZIMUTH GEOLOG.

DETECTION LIMIT 5
nd = none detected -- = not analysed is = insufficient sample

VANGEOCHEM LAB LIMITED

MAIN OFFICE: 1521 PEMBERTON AVE. N.VANCOUVER B.C. V7P 2S3 PH:(604)986-5211 TELEX:04-352578
BRANCH OFFICE: 1630 PANDORA ST. VANCOUVER B.C. V5L 1L6 PH:(604)251-5656

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 3 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SR,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

COMPANY: AZIMUTH
ATTENTION:
PROJECT: 87-06-29

REPORT#: 870898PA
JOB#: 870898
INVOICE#: 870898NA

DATE RECEIVED: 87/07/30
DATE COMPLETED: 87/09/16
COPY SENT TO:

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PB,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

ICAP GEOCHEMICAL ANALYSIS

A .5 GRAM SAMPLE IS DIGESTED WITH 5 ML OF 3:1:2 HCL TO HNO3 TO H2O AT 95 DEG. C FOR 90 MINUTES AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR SN,MN,FE,CA,P,CR,MG,BA,PD,AL,NA,K,W,PT AND SR. AU AND PD DETECTION IS 3 PPM.
IS= INSUFFICIENT SAMPLE, ND= NOT DETECTED, -= NOT ANALYZED

COMPANY: AZIMUTH GEOLOG.
ATTENTION:
PROJECT: 87-06-29
