INTRODUCTION

- i) The Pine mineral claims are located 12 kilometers southeast of Kimberley, B.C., within the Rocky Mountain Trench. The land surface of the claim area is relatively flat with low glacially rounded hills and small stream-cut gullies. The St Mary River crosses the southern portion of the claim group. Bedrock exposures are sparse as considerable glacial drift is present.

Access to the claims is by road; Highway 95A and numerous secondary roads cross the claim group.

- ii) The Pine claim group, staked in 1985, consists of 116 claim units in 7 claims.

Victoria Resource Corporation is the owner of the claims and operator of the work reported on here.

The Pine mineral claims are located on the western flank of a very large regional aeromagnetic anomaly which is centered on a cluster of small Cretaceous age intrusive bodies of quartz monzonite and granodiorite composition. These intrusions cut into metamorphosed fine-grained clastic sedimentary rocks of Cambrian to Proterozoic age. Two of the rock formations, the Creston formation and Aldridge formation, are known to host mineral deposits ranging from lead-zinc-silver to copper-silver and gold. Anomalous base and precious metals have been located on the Pine claims.

- iii) Summary of Work Reported on:

Geological mapping on a scale of 1:10,000 covering most of the bedrock exposures in the claim area (2900 hectares), 5.1 line kilometers of magnetometer surveying and 222 meters of percussion drill sampling are being reported on.

The magnetometer used is a Scintrex MP-2 proton precession magnetometer, measuring the total magnetic field with a reported precision of 1 gamma.

- iv) List of Claims on Which Work was Actually Performed:

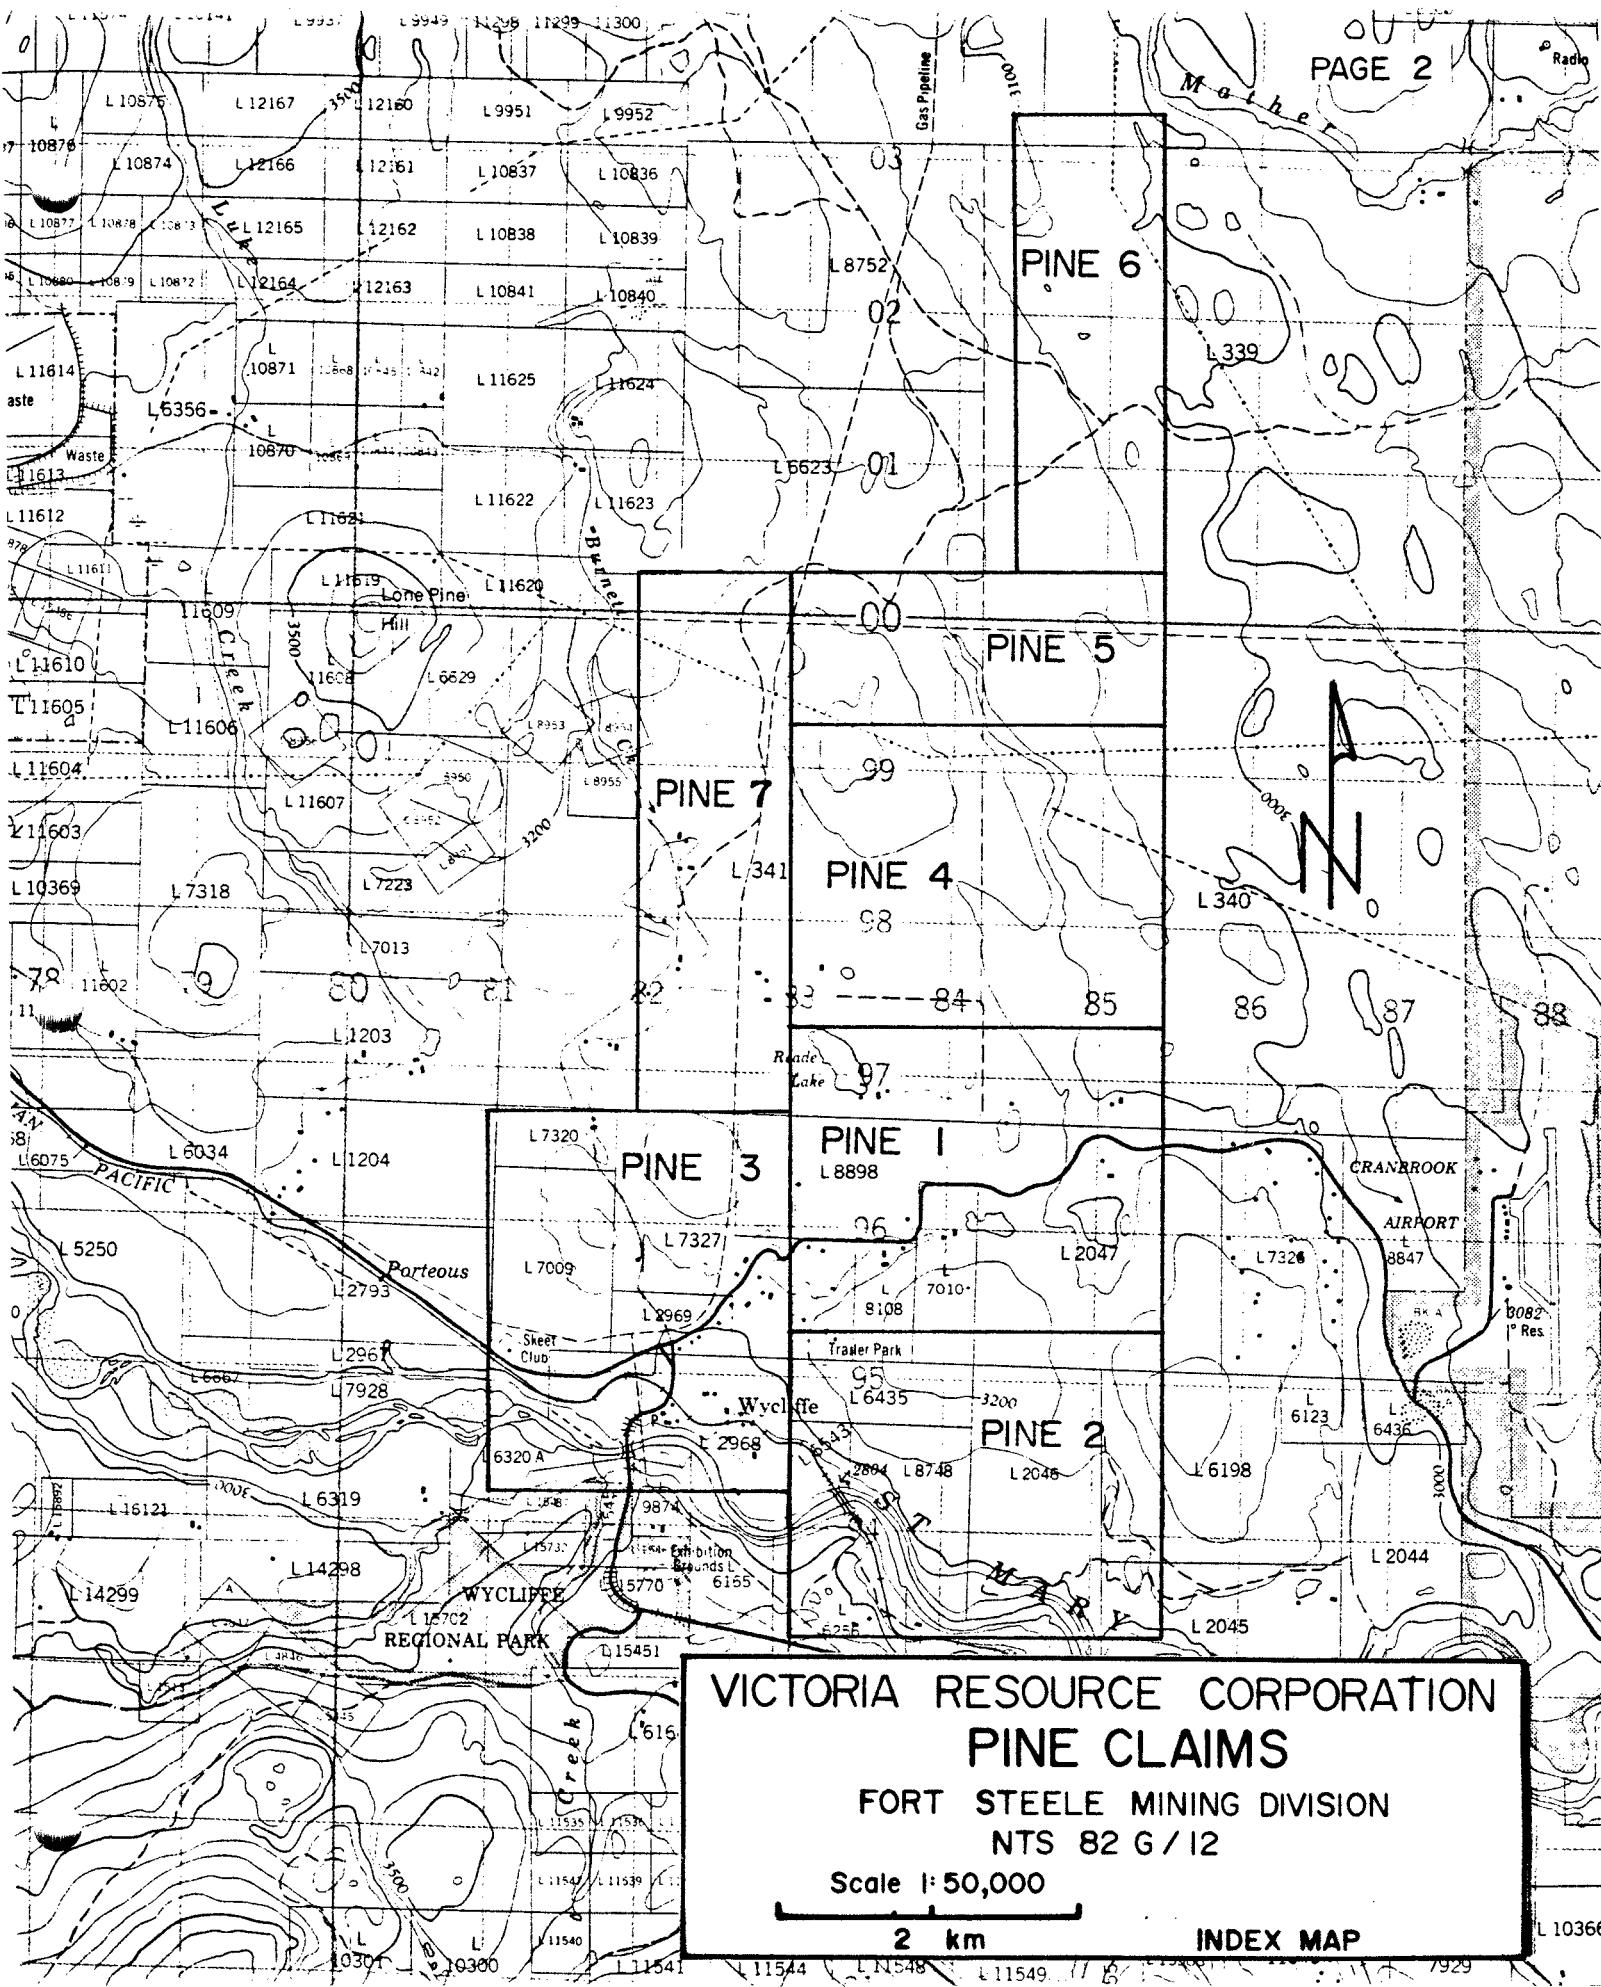

Geological Mapping Pine 1, 3, 4, 5, 7

Magnetometer Survey Pine 1

Percussion Drilling Pine 5

DETAILED TECHNICAL DATA AND INTERPRETATION

i) Purpose:

Geological mapping on a scale of 1:10,000 was carried out to evaluate the field relationships of the Cretaceous intrusives and the metamorphosed sedimentary rocks which they intrude. Selective rock samples were collected and analysed for base and precious metals.

Geophysical magnetometer surveying on 5.1 line kilometers was performed to establish the magnetic response of small intrusive bodies on the east side of McLure Lake.

Percussion drilling was done to collect chip samples of overburden and bedrock as a follow-up procedure to evaluate anomalous gold mineralization detected by an earlier soil geochemistry survey. Twenty-seven vertical holes with a diameter of 6.35cm ranging from 4.5m to 12m in depth were drilled for a total length of 222 meters. The area covered by this drilling is 12 hectares.

ii) Results

Geological Mapping

Bedrock in the area of the Pine Claims consists of Cambrian to Proterozoic age metamorphosed fine-grained clastic sedimentary rocks belonging to the Eager, Kitchener, Creston and Aldridge Formations. On the Pine 1 mineral claim (eg. east of McLure Lake) the sedimentary rocks are cut by small intrusive bodies of quartz monzonite or granodiorite composition. Intense alteration of the sedimentary rocks occurs locally on the contacts. Anomalous gold mineralization is present in these altered zones and in small quartz or quartz-carbonate veins which are present in both the intrusives and the adjacent metamorphosed sedimentary rocks.

Magnetometer Survey

A detailed magnetometer survey was done over a 48 hectare area on 5.1 line kilometers east of McLure Lake (see Plates 1 and 2). The local magnetic gradient rises to the east, reflecting the location of the area on the west flank of the very large magnetic high detected by government airborne surveys in 1969-70. Individual magnetometer readings in the survey area have a range of 1100 gammas from a low of 58,000 gammas to a high of 59,100 gammas; the extreme values are very localized. The magnetometer survey detected a series of anomalous magnetic highs and lows in an area where intrusive rocks cut pyrrhotite-bearing siltstones and argillites. Some of the magnetic anomalies are centered on metasedimentary rocks, others are centered on the intrusives.

ii) Results (continued)

Percussion Drilling

A percussion drill program sampled overburden and bedrock over a 12 hectare area on the Pine 5 mineral claim (see Plates 1 and 3). Twenty-seven holes, 6.35cm in diameter were drilled to depths ranging from 4.5m to 12m for a total of 222 meters. The holes were drilled on 50m east-west spacings on lines 100m apart. Cuttings were collected across 1.5m intervals in both overburden and bedrock. The 148 samples collected were analyzed for gold and a 32 element ICP package.

Bedrock in the drill area ranges from 0 to >12m and consists of thin bedded to laminated green and gray chloritic argillites and siltstones that are interpreted to be part of the Creston Formation. Overburden thickness in the drilling area increases to the east and some of the eastern holes did not reach bedrock.

Low anomalous gold values from 5 to 40ppb occur in 9 samples along the west and south margins of the grid area. Some of these anomalous values are from near-surface samples and are probably due to gold in surface soil but the majority of the anomalous gold values are from deeper in the holes and represent a bedrock source.

Anomalous values were also detected for silver, arsenic, copper, lead and zinc. These are unevenly distributed in the grid area and are from both overburden and bedrock sources. Anomalous results are shown on Plate 3.

iii) Interpretation

Geology

Bedrock in the area of the Pine claims consists of metamorphosed Cambrian to Proterozoic age fine-grained clastic sedimentary rocks belonging to the Eager, Kitchener, Creston and Aldridge Formations. On the Pine 1 mineral claim, small Cretaceous age quartz monzonite / granodiorite intrusions cut the metasedimentary rocks and produce localized alteration. Anomalous gold mineralization is present in quartz and quartz-carbonate veins which are interpreted to be associated with the intrusions.

Magnetometer Survey

An area of anomalous magnetic response east of McLure Lake on Pine 1 is coincident with a series of small Cretaceous intrusions. Magnetic pyrrhotite is present in the adjacent metasedimentary rocks and magnetite is present in the intrusives; either or both of these minerals may be responsible for the magnetic anomalies.

No diurnal corrections were made during the survey. To check for diurnal variations during the survey, numerous repeat readings were made of previously surveyed stations. Maximum variations experienced were in the order of 20 to 30 gammas and these are considered relatively insignificant in this area of strong magnetic variation.

Percussion Drill Sampling

Anomalous base and precious metals present in the area of the percussion drilling may be related to an inferred northwesterly trending fault which crosses the grid area.

Storage of percussion drill cuttings.

The percussion drill cuttings are stored at the Littlebrook Ranch, approximately three kilometers northeast of the north end of the Pine 6 mineral claim.

iv) Conclusions

Geochemically anomalous gold, silver, copper, lead and zinc are present on parts of the Pine claims. The mineralization is interpreted to be associated with faults and Cretaceous quartz monzonite / granodiorite intrusives.

AUTHOR'S QUALIFICATIONS

As author of this report I, Peter Klewchuk, certify that:

I am a graduate geologist with a BSc degree (1969) from the University of British Columbia and an MSc degree (1972) from the University of Calgary.

I have been actively involved in mining and exploration geology, primarily in the province of British Columbia, for the past 15 years.

A considerable portion of my geological experience has been in the Kimberley - Cranbrook area and I am familiar with the rock units of the map area reported on here.

ASSESSMENT REPORT

NTS 82 G/12

December 12, 1987

PERCUSSION DRILL HOLE LOGS

Hole 1	0-1.5m	Med. gray siltstone. Purple quartzite chips and sand from overburden.
	1.5-3m	Med. gray siltstone, rusty fractures. Purple quartzite from overburden.
	3-4.5m	Gray and green siltstone and argillite.
	4.5-6m	Gray and minor green siltstone - individual chips are massive.
	6-7.5m	Siltstone and argillite, med. blue-gray. Very minor pale green quartzite.
	7.5-9m	Blue-gray siltstone and argillite, a few quartz vein chips.
Hole 2	0-1.5m	Sand and gravel, blue-gray siltstone. About 3% vein quartz fragments, possibly overburden.
	1.5-3m	Massive and laminated blue-gray to gray-green siltstone and argillite. Few chips of gabbro and buff quartzite from overburden.
	3-4.5m	Silt (?).
	4.5-6m	Gray, green and gray-green siltstone and argillite. Some laminated chips.
	6-7.5m	Gray-green siltstone and argillite. Few white to yellow-brown quartzite chips (overburden).
	7.5-9m	Gray-green siltstone and argillite. Few vein quartz, quartzite and gabbro chips.
Hole 3	0-1.5m	Sand and gravel, blue-gray siltstone, gray quartzite.
	1.5-3m	Mainly blue-gray siltstone but with numerous chips of white, pink and green quartzites which are evidently from overburden.
	3-4.5m	Blue-gray siltstone and argillite. Most chips are massive but some are laminated. Rusty fracture surfaces. Few white and gray, probable overburden quartzites.

4.5-6m Blue-gray argillites and siltstones, some rusty fractures. A few white and yellow-brown quartzites.

6-7.5m Green to gray to blue-gray laminated to massive siltstone and argillite. Few chips of white quartzite.

7.5-9m Mainly blue-gray to greenish-gray siltstone and argillite. Few chips of white quartzite.

Hole 4 0-1.5m Gravel, sand and silt. Few chips of green to blue-gray laminated to massive argillite and siltstone.

1.5-3m Blue-gray and green siltstone and argillite; a few angular chloritic gabbro and white quartzite chips.

3-4.5m Blue-gray, minor green argillite. Rusty fractures. Few overburden fragments of gabbro and white and purple quartzites.

4.5-6m Blue-gray to gray-green siltstones. A few pale green quartzites or silty quartzites. Some fracture surfaces are rusty.

6-7.5m Pale green and gray-green siltstone and silty quartzite with about 30% blue-gray siltstone. A few larger fragments of gabbro and white quartzite.

7.5-9m Pale green to gray-green siltstones. Some laminations.

Hole 5 0-1.5m Gravel, sand and clay.

1.5-3m Gravel, sand and clay.

3-4.5m Gravel, sand and clay.

4.5-6m Gravel, sand and clay.

6-7.5m Sand, pebbles of quartzite, chips of gray argillite.

7.5-9m Mostly blue-gray argillite and siltstone. Some phyllitic chips. Few rusty fractures. Few vein quartz chips.

9-10.5m Mainly blue-gray to green argillite and siltstone. Some laminated. Few white, green and purple quartzites. Rusty fractures.

10.5-12m Blue-gray and greenish argillite and siltstone. Rusty fractures, minor vein quartz.

Hole 6 0-1.5m Gravel, sand and silt.

 1.5-3m Gravel, sand and silt.

 3-4.5m Gravel, sand and silt.

Hole 7 0-1.5m Gravel and sand.

 1.5-3m Blue-gray and greenish siltstone. Rusty fractures. Some overburden quartzite chips.

 3-4.5m Blue-gray and greenish siltstones. Individual chips are massive. Few med. grained white quartzites.

 4.5-6m Blue-gray to greenish siltstones. Some laminated chips. Few white to pink overburden quartzites.

 6-7.5m Blue-gray to gray-green siltstone. Few laminated chips; most are massive. Few pale gray-green fine-grained quartzites.

 7.5-9m Mainly blue-gray siltstone. Few greenish siltstone chips.

Hole 8 0-1.5m Gravel and sand.

 1.5-3m Gravel and sand.

 3-4.5m Sand with very few gravel pebbles.

 4.5-6m Sand with few gravel pebbles.

 6-7.5m Sand.

 7.5-9m Sand.

Hole 9 0-1.5m Fine sand with about 25% pebbles and chips of blue-gray siltstone.

 1.5-3m Blue-gray to gray-green siltstone. Chips are massive. Some sand and small quartzite chips.

 3-4.5m Blue-gray to gray-green siltstone. Chips are small and flat - bedrock may be foliated. Numerous small 'limonitic' aggregates of muddy material could be oxidized fault gouge.

 4.5-6m Light gray to dark blue-gray and greenish siltstone. Chips are small and flat. Numerous rounded overburden quartzite pebbles.

 6-7.5m Small flat chips of light to med. blue-gray to green siltstone. Gray clay may be a product of ground argillite.

Hole 10 0-1.5m Sand and gravel.

 1.5-3m Sand and gravel.

 3-4.5m Sand and gravel. Angular pebbles of blue-gray siltstone.

 4.5-6m Sand and gravel. Angular pebbles of blue-gray siltstone.

 6-7.5m Sand and gravel. Angular fragments of blue-gray siltstone.

 7.5-9m Silt, sand and fine gravel.

Hole 11 0-1.5m Sand and gravel.

 1.5-3m Sand and gravel.

 3-4.5m Sand and gravel.

 4.5-6m Light to dark blue-gray siltstone. Some laminated chips. 15% rounded pebbles from overburden.

 6-7.5m Mainly blue-gray and gray-green siltstone. Laminated chips common. Rusty fracture surfaces. Quite a variety of color variations.

7.5-9m Blue-gray, gray-green and brownish siltstone. Brownish chips may be an iron staining associated with faulting. Few vein quartz chips.

Hole 12 0-1.5m Sand and gravel.

1.5-3m Sand, gravel and clay.

3-4.5m Blue-gray to green laminated siltstone. 4% vein quartz chips as well as numerous overburden quartzite chips.

4.5-6m Blue-gray to green siltstone. Rusty fracture surfaces.

6-7.5m Light to dark blue-gray siltstones, some greenish. Laminations common. Few vein quartz fragments. Rusty fracture surfaces. Considerable clay in the sample.

7.5-9m Light to dark blue-gray siltstones, similar to overlying interval.

Hole 13 0-1.5m Sand and gravel.

1.5-3m Sand, clay and gravel.

3-4.5m Sand, clay and gravel.

4.5-6m Light gray to dark blue-gray siltstone. Laminations common. About 20 or 30% clay.

6-7.5m Quite similar to overlying interval. Clay may be from caving of overburden or ground argillite.

7.5-9m Similar to overlying intervals.

Hole 14 0-1.5m Sand and gravel.

1.5-3m Sand, gravel and clay.

3-4.5m Sand and gravel.

4.5-6m Sand, gravel and clay.

6-7.5m Mainly greenish-gray clay with minor gravel.

7.5-9m Mainly greenish-gray clay with minor gravel.

Hole 15 0-1.5m Sand and gravel.

1.5-3m Sand and gravel, chips of larger boulders.

3-4.5m Medium to dark blue-gray siltstone with about 3% light green quartzite. 10% overburden quartzite chips and pebbles.

4.5-6m Similar to 3-4.5m.

6-7.5m Medium to dark blue-gray siltstone with few greenish quartzite chips. Clay is present, possibly ground up argillite.

7.5-9m Clay, chips of blue-gray siltstone and argillite.

Hole 16 0-1.5m Sand and gravel.

1.5-3m Sand and gravel.

3-4.5m Clay, sand and gravel.

4.5-6m Little clay. Numerous lithologies - evidently a lot of overburden contamination - quartzites and siltstones of different colors.

6-7.5m Green clay. Chips of grayish green argillite and siltstone.

7.5-9m Similar to 6-7.5m.

Hole 17 0-1.5m Sand, 30% gravel.

1.5-3m Sand and gravel.

3-4.5m Sand, gravel and a little clay.

4.5-6m Sand, gray-green clay, chips mainly of greenish argillite and siltstone. Chips of whitish quartzites are common (presumably overburden).

6-7.5m Sand, gray clay. Chips of blue-gray to green siltstone. Also white, light green and brownish-red quartzites.

7.5-9m Similar to 6-7.5m, less clay.

Hole 18	0-1.5m	Sand and gravel.
	1.5-3m	Sand, clay and gravel. Chips of blue-gray argillite and siltstone.
	3-4.5m	Gray clay, chips of light gray to gray-green and green siltstone and fine-grained quartzite. About 5% rounded overburden pebbles of reddish and whitish quartzites.
	4.5-6m	Similar to 3-4.5m.
	6-7.5m	Similar to 3-4.5m.
	7.5-9m	Light gray, medium blue-gray and gray-green siltstones. Commonly laminated. Rusty fracture surfaces. About 6% white to brown overburden quartzites.
Hole 19	0-1.5m	Sand and gravel.
	1.5-3m	Light gray to gray-green siltstone and quartzite. 20% rounded overburden quartzites. Few chips of vuggy, rusty vein quartz.
	3-4.5m	Light to medium blue-gray and gray-green siltstone. About 7% rounded overburden pebbles of quartzite.
	4.5-6m	About 20 or 25% clay and silt, probably ground up argillite. Chips of blue-gray to green argillite and siltstone. Numerous rusty chips. About 5% rounded overburden pebbles.
	6-7.5m	Blue-gray to green argillite. Typically laminated. Few rusty-spotted chips of vein quartz.
	7.5-9m	Very similar to 6-7.5m. Chips are very small.
Hole 20	0-1.5m	Sand and gravel.
	1.5-3m	Sand, silt and fine gravel.
	3-4.5m	Clay, silt, sand and fine gravel.
	4.5-6m	Gravel and clay, minor silt and sand. Most common chips are gray-green siltstone, but numerous lithologies are present.

	6-7.5m	Light gray to blue-gray and green siltstone. 15% rounded overburden pebbles and angular miscellaneous quartzites.
	7.5-9m	Medium blue-gray to greenish siltstones. Few vein quartz chips, non-rusty. About 5% overburden quartzites.
Hole 21	0-1.5m	Sand and gravel.
	1.5-3m	Medium gray to gray-green argillite and siltstone. Few vein quartz chips.
	3-4.5m	Similar to 1.5-3m, with a few clay 'balls'.
	4.5-6m	Clay and silt (pulverized argillite). Light gray to blue-gray and gray-green siltstone and argillite. Few vein quartz chips with rusty vugs.
	6-7.5m	Light gray to medium blue-gray to gray-green argillite and siltstone. Some laminated chips. Few vein quartz chips. About 5% overburden quartzites.
	7.5-9m	Clay and silt from ground argillite. Light gray to medium blue-gray and green siltstone and argillite. About 10% light colored overburden quartzites.
Hole 22	0-1.5m	Sand and gravel.
	1.5-3m	Large angular chips of blue-gray siltstone. 15% quartzites.
	3-4.5m	Blue-gray siltstone and argillite, lots of rusty chips. Few vein quartz chips. Few quartzite chips.
	4.5-6m	Buff-gray, blue-gray and gray-green siltstone and argillite. Laminations common.
	6-7.5m	Light to medium blue-gray argillite and siltstone, typically laminated. 7% rusty chips.
	7.5-9m	Similar to 6-7.5m but with rusty-brown clay and 10% rusty fragments giving the impression that a fault zone with gouge is present in this interval.

Hole 23 0-1.5m Sand and gravel.

1.5-3m Brown sand.

3-4.5m Sand, very minor fine gravel.

Hole 24 0-1.5m Sand and gravel.

1.5-3m Mainly light blue-gray argillite with 30% rounded and angular pebbles of various lithologies - quartzites to gabbros.

3-4.5m Blue-gray, gray-green and brownish argillite and siltstone; 30% rusty chips with rusty silt - possible fault zone. About 8% overburden quartzites.

4.5-6m Distinct change to >90% light blue-gray siltstone. 3% rusty chips, 3% overburden quartzites.

Hole 25 0-1.5m Sand and gravel. Large angular chips of blue-gray siltstone.

1.5-3m Sand, gravel with 65% chips of dark blue-gray siltstone. 35% chips of various quartzites, minor gabbro.

3-4.5m Minor sand and clay. 80% dark blue-gray siltstone. 20% chips of miscellaneous lithologies, mainly quartzites. Few chips of vein quartz with rusty vugs.

4.5-6m Dark blue-gray siltstone. Minor lighter gray and gray-green siltstone and argillite. Few pebbles and chips of light quartzites.

Hole 26 0-1.5m Sand and gravel.

1.5-3m 85% dark blue-gray siltstone. 15% overburden quartzites, green to white.

3-4.5m Light, medium and dark blue-gray argillite and siltstone. About 10% light colored pink, white, green and gray quartzites.

4.5-6m Gray-green to dark blue-gray argillite and siltstone. Small chips, most appear massive but a few are laminated. Few vein quartz chips.

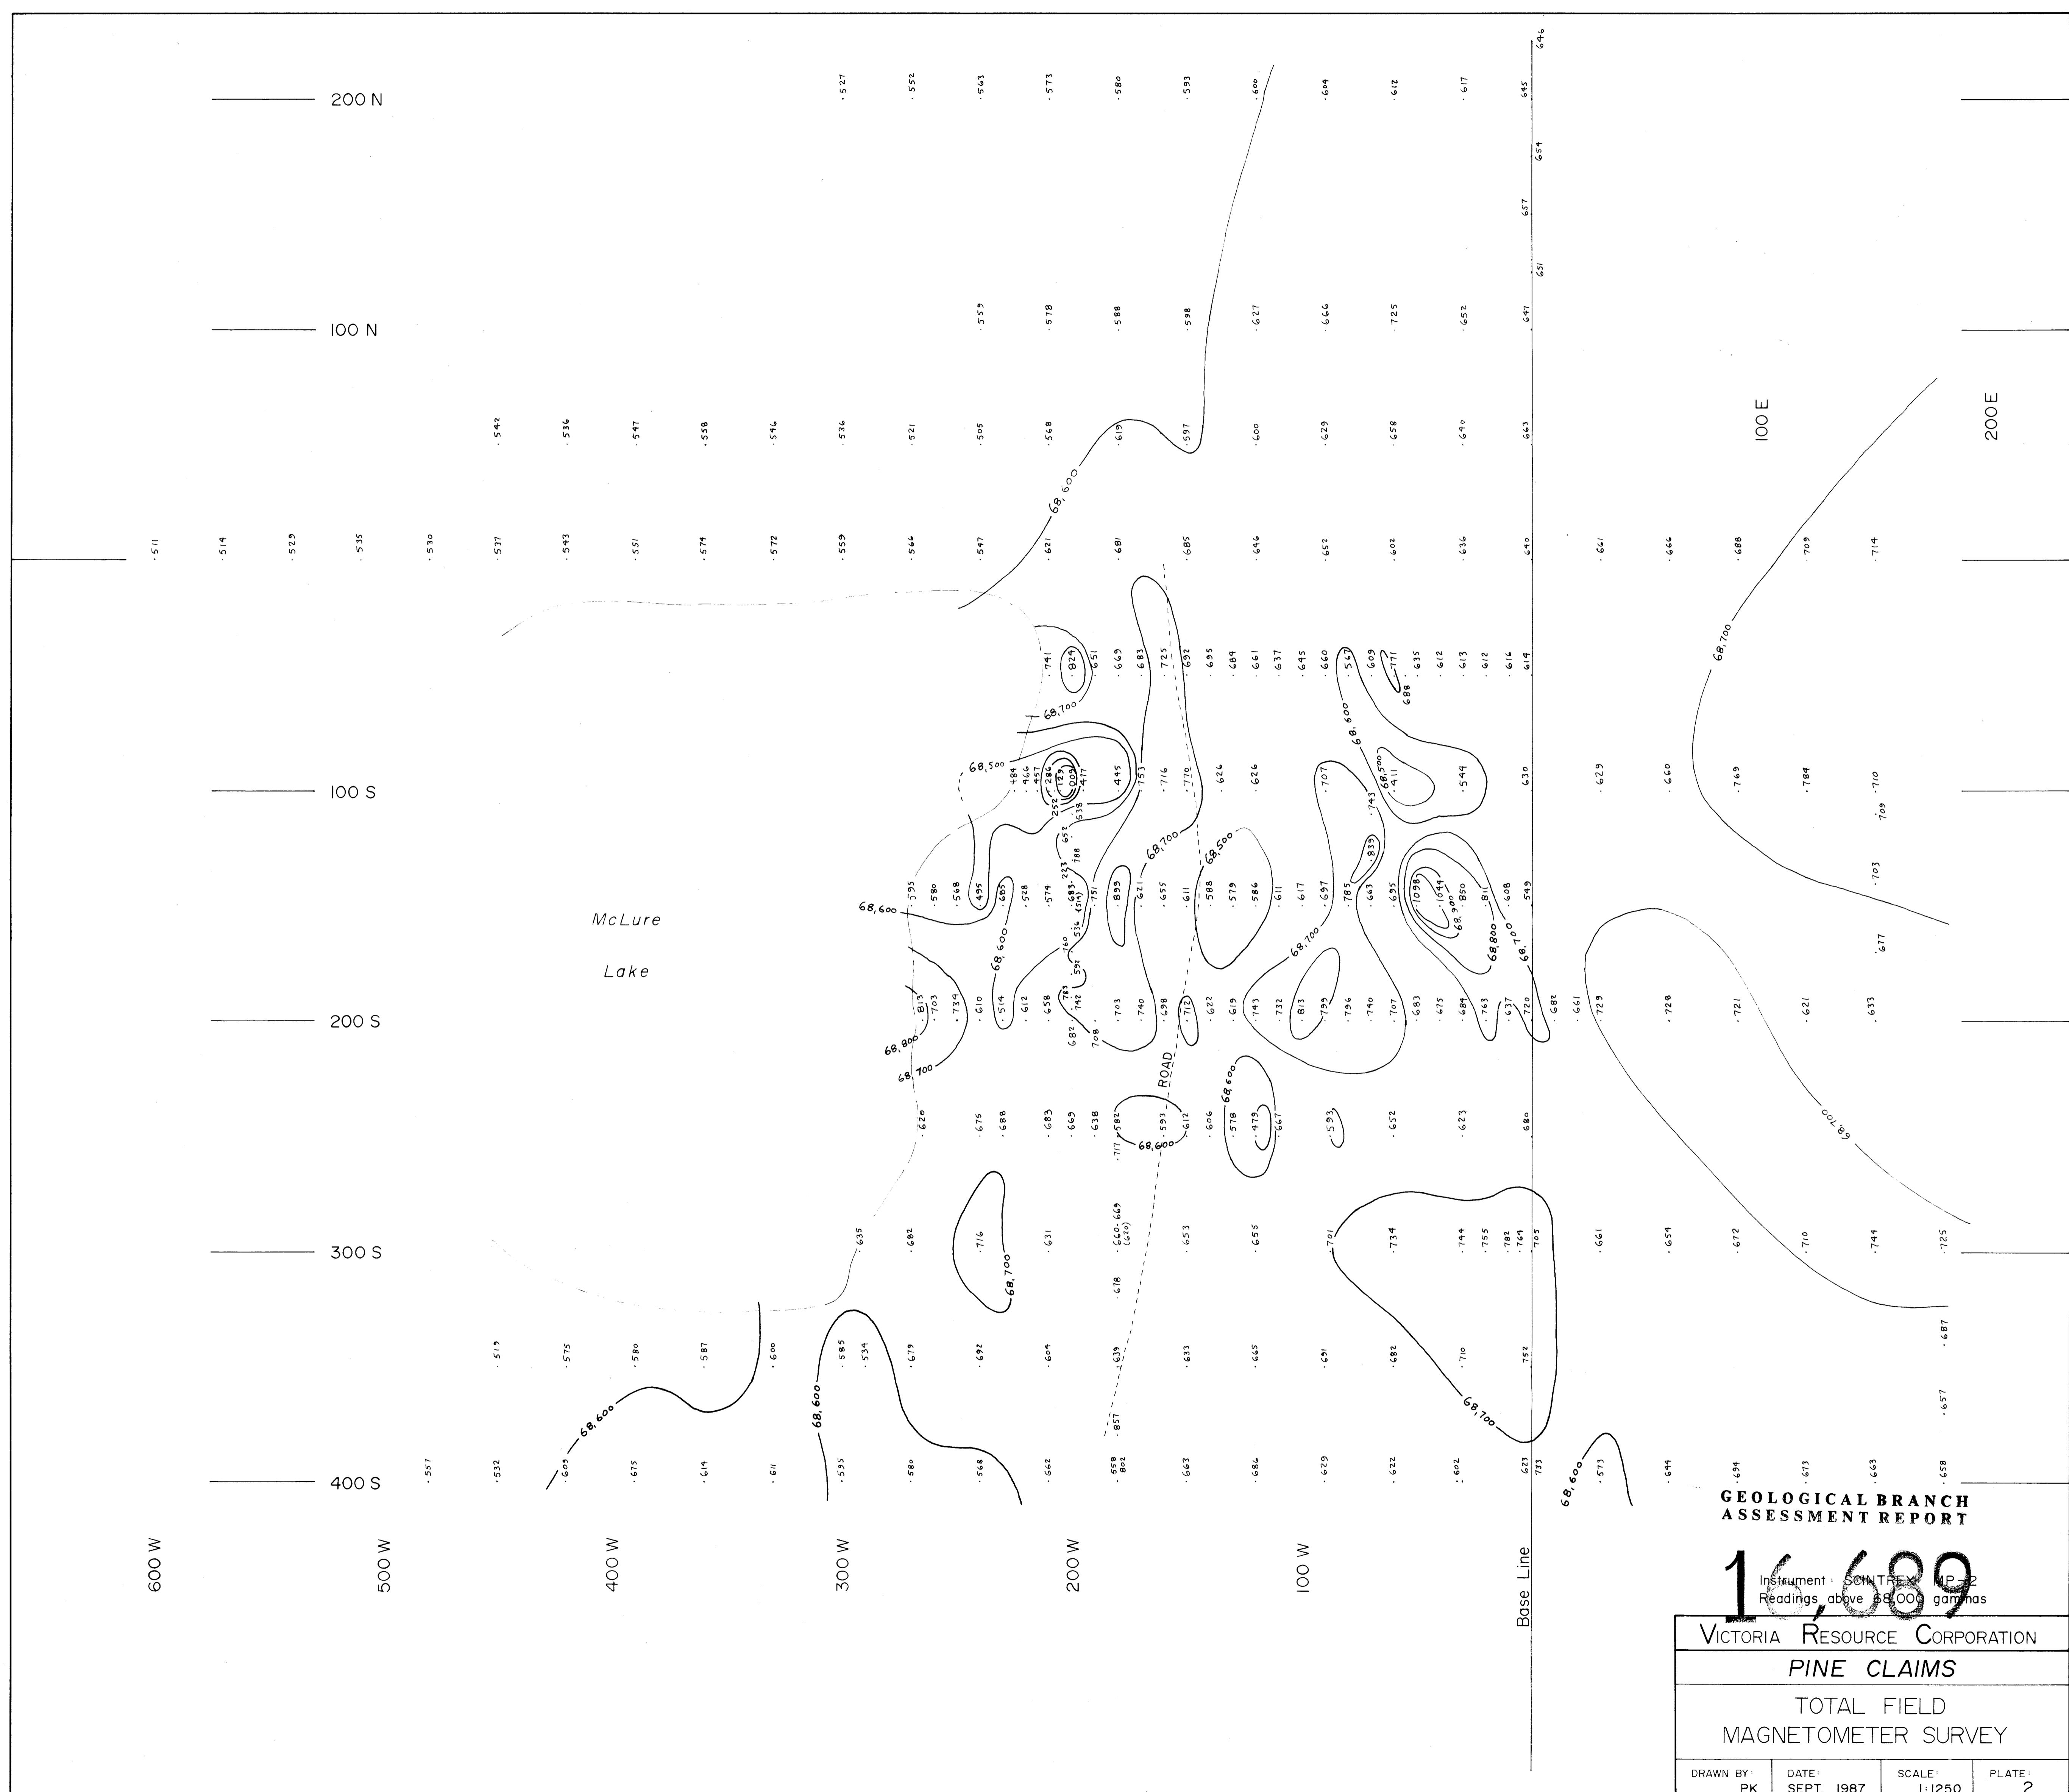

Hole 27 0-1.5m Sand and gravel.

1.5-3m Minor sand. Mainly dark gray-green, blue-gray siltstone.

3-4.5m Dark gray-green and blue-gray siltstone. Less than 5% overburden quartzites.
