GEOLOGICAL & GEOCHEMICAL REPORT ON THE GOLDBELT 2 AND GAMBLE CLAIMS

I Introduction

The property consists of 32 claim units that were acquired due to their proximity to known gold production in the Sheep Creek area. In the past a limited amount of exploration has been carried out, primarily in the form of physical work. Evidence of a small amount of underground development and trenching by previous owners of the ground exists.

The Goldbelt 2 and Gamble claim groups are situated on the east slope of Reno Mountain, 19 km by road from the village of Salmo. Access to the property is via the Sheep Creek road to the southern claim boundary.

Vegetation on the property ranges from heavy timber at low elevations to alpine meadow near the ridge crests.

Current owner of the property is Goldrich Resources Inc. and current operator is Lightning Minerals Inc..

The Sheep Creek gold camp, in which these claims are located, has a long history of mining activity dating from the late 1800's. The Reno mine located 1 km to the west was one of the major producers in the camp. There has been no known production on the Goldbelt 2 and Gamble claims.

In 1987, Lightning Minerals Inc. initiated a program of geological mapping and soil geochemistry to test a zone of Lower Cambrian sediments in the western portion of the Goldbelt 2 claims and along the boundary between the Goldbelt 2 and Gamble claims. Mapping covered 2.7 square kilometres on a scale of 1:7500 and geochemical work included 196 soil and silt samples and 18 rock chip samples.

The personnel employed on this claim block were P. Hannigan, B. Hitchins, P. Lounsbury, C. Maclean and J. Ellerington. Field work was performed on October 2, 4, 5, 6, 7, 8 & 9, 1987.

II Detailed Technical Data and Interpretation

a. Geology

A small geological mapping and soil sampling program was instigated in an effort to test the property for gold mineralization in the vicinity of a repetition of Lower Cambrian sediments that are the host rock for gold bearing quartz veins in the Sheep Creek area. Objective of the mapping was to define the contacts and examine outcrops

FIG. 1A

for structural or mineralogical indications of economic significance. The purpose of the geochemical program was to test the area for anomalous gold content or other indicator elements.

i. Regional:

The property is situated on the axis and flanks of a major fold referred to as the Sheep Creek Anticline which extends from the northern property boundary south and west for about 20 km. The general area is complexly folded in a series of parallel syncline and anticline features. A sedimentary series forms a belt about 6 km wide in a north-south orientation. This belt has seen extensive gold production along its western boundary from a series of east-west quartz veins.

ii. Property Geology:

The dominant formations underlying the claims are the Cambrian Laib Formation, Reno Formation and the Quartzite Range Formation. These are predominantly composed of quartzites, argillites, phyllites and limestones. Much of the gold production of the Sheep Creek area has taken place in the Nugget and Nevada Members of the Quartzite Range Formation.

Mapping was carried out utilizing aerial photographs for general control. Detail work was carried out using hip chain and compass traverses.

Most outcrop was located on ridges, whereas down-slope the terrain became heavily timbered with limited outcrop. Stream channels also provided a fair degree of bedrock exposure. Sufficient outcrop was located to reasonably define the contact zones between the various formations and members. It was also possible to locate the axis of the Sheep Creek anticline and the Laib syncline. A strong fault referred to as the Weasel Creek Fault, which strikes 020 degrees, was traced across the property. It produces a repetition of a sequence of beds.

A large number of quartz zones were noted, particularly in the Nugget and Nevada Members, although most were of a bedding concordant variety. A few cross-cutting veins were noted as well.

A small adit and dump were located about 500 metres west of Sheep Creek. Orientation of the adit appeared to be 320 degrees, however, no access was possible due to cave-in. Sampling of quartz zones in the area did

not produce any anomalous gold results.

iii. Discussion of Results:

Mapping provided reasonable control on the location of the various geological contacts. Rock samples were not anomalous in gold, silver, lead, zinc, copper or arsenic. It appears that while the favorable rocks from the Sheep Creek mining camp area occur on the claims, there is a missing mineralization control that has resulted in there being no economic occurrences.

b. Geochemistry:

i. Sampling Method:

Soil samples were collected from the B soil horizon with a grub-hoe. Soils were pre-dominantly silts with a rusty brown colour. Samples were collected at 50 metre intervals along several traverse lines in the Sheep Creek valley. In total, 196 samples were collected.

ii. Laboratory Procedure:

Soil sample analysis was carried out by Rossbacher Laboratory Ltd., 2225 S. Springer Ave., Burnaby, B.C.. Samples were dried at 60 degrees C. and sieved at 80 mesh. Digestion of the samples was by perchloric acid. Analysis was carried out by atomic absorption.

iii. Discussion of Results:

No significant gold anomalies were detected. The other elements are of limited economic concern at the present time. Zinc, lead, copper, silver and arsenic showed only minor fluctuations from background levels.

III Recommendations:

In view of the low order of magnitude of the rock and soil analytical results, additional work on the claims area is of low priority. The western portion of the Goldbelt 2 claims may be more favorable than the Sheep Creek valley for additional work.

STATEMENT OF QUALIFICATIONS

I, James Ellerington, do hereby certify that:

1. I am a geologist employed by Lightning Minerals Inc., 202, 7608 - 103 Street, Edmonton, Alberta, T6E 4ZB.
2. I am a graduate of the University of Alberta with a BSc Degree in Geology (1967).
3. I have practised my profession since graduation. My previous employers include: Great Plains Development of Canada Ltd., United Keno Hill Mines Ltd., Eldorado Nuclear Ltd., Saskatchewan Mining Development Corporation and Terra Mines Ltd..
4. This report is based on field exploration work carried out in the fall of 1987. Research of government reports was also involved.
5. I have no interest, directly or indirectly in the property described in the report.

Respectfully submitted

James D. Ellerington
November 15, 1987
