SUMMARY

The ATO group of claims are located on the Omineca mountains north-central British Columbia and consist of 60 units. Geologically the claims straddle the boundary between the Triassic Takla andesitic volcanics and the Jurassic Hogem batholith intrusive suite. It is the contact that is of economic interest since mineral concentration is found along it to the south.

Numerous soil and rock samples collected show small gold anomalies that need to be followed up. One intrusive rock that was collected ran a significant 29,130 ppb Au and requires immediate follow-up to ascertain the nature and origin of the mineralization. Numerous copper anomalies were also located and should be examined in more detail.

1.1 General Setting and Location

The ATO group of claims are located in the Omineca mountains, Swannell Range north-central British Columbia (refer to Figure 1 and 2) approximately 40km northwest of Germansen Landing. The road from Germansen Landing to Uslika Lake comes to within 5km to the east of the property.

Physiographically the area consists of valleys at 1100m which give way to alpine type vegetation on sharp ridges which rise up to 2000m. Access to the property is presently by helicopter.

2.1 Property

The ATO property consists of 3 claim blocks which are 100% owned and operated by Cathedral Gold Corporation. The claims have been grouped and consist of the following:

<u>Claim Name</u>	<u>Record Number</u>	<u>Number of Units</u>	<u>Expiry Date</u>
ATO I	7948	20	Oct. 3, 1987
ATO II	7949	20	Oct. 3, 1987
ATO III	7950	20	Oct. 3, 1987

3.1 Work Completed

A helicopter supported fly camp was established on the ATO claims (see Figure 3) from July 18 through July 23, 1987. A total of 144 soil samples were collected from the B horizon approximately 15-20cm depth where possible. These soils were collected along contour lines at 50m intervals and also beside anomalous drainages. All sample locations were flagged in the field. A total of 53 rocks from both outcrop and float were also analysed.

All samples were analysed by Acme Labs of Vancouver for 30 elements by ICP methods and gold by atomic absorption (refer to Appendix 1 for method).

4.1 Interpretation

The claims are apparently underlain by the Hogem batholith - Takla Volcanic contact which is a somewhat irregular contact due to the presence of numerous pendants, dykes and silts and various hybrid intrusive phases assimilating wall rock material. Overall Takla rocks consist of fine to porphyritic andesite in contact with intrusive diorite of the Hogem suite.

Of the 53 rocks collected only one (ATO-87-5R) ran significantly in gold (29,130 ppb) and this needs to be followed up in detail. This rock is a malachite stained intrusive diorite with visible chalcopyrite. A number of other intrusive rocks carried significant copper contents. Of the soils collected a total of 8 ran greater than 100 ppb Au and these areas should also be further investigated.

RECOMMENDATIONS

1. Follow-up sampling and detailed mapping to locate origin of anomalous boulder (5R).
2. Further soil samples in the southern part of the claim to further evaluate the mineral potential.

CERTIFICATE

I, Alan B. Taylor, geologist, residing at 15-8720 Maplegrove Crescent in the Municipality of Burnaby, Province of British Columbia, hereby certify that:

1. I graduated from Brock University in 1979 with an Honours Bachelor of Science in Geology.
2. I graduated from the University of Western Ontario in 1984 with a Master of Science in Geology.
3. I have worked for various mining companies and government geological surveys since 1977.
4. I am presently a permanent staff geologist with Imperial Metals Corporation of 800-601 West Hastings Street, in the City of Vancouver, Province of British Columbia.
5. The work described in this report on the ATO claims was undertaken under my direct supervision.

DATED at the City of Vancouver this 23 day of December, 1987.

Alan B. Taylor, Geologist
